<td><strong>Program Task:</strong> Calculate driver productivity of forklift drivers.</td>
<td><strong>PA Core Standard:</strong> CC.2.1.HS.F.4</td>
<td><strong>Description:</strong> Use units as a way to understand problems and to guide the solution of multi-step problems.</td>
</tr>
<tr>
<td><strong>Program Associated Vocabulary:</strong> PRODUCTIVITY, PALLETS PER HOUR, DOWNTIME, RATE</td>
<td><strong>Math Associated Vocabulary:</strong> RATE, DECIMAL, RATIO, DIMENSIONAL/UNIT ANALYSIS</td>
<td></td>
</tr>
<tr>
<td><strong>Program Formulas and Procedures:</strong> Companies keep statistics on the productivity of their forklift drivers. Driver productivity is usually described in terms of pallets per hour. It may seem like 14 and 15 pallets per hour are pretty close numbers, but they have significant implications over time for larger businesses.</td>
<td><strong>Formulas and Procedures:</strong> Dimensional or Unit Analysis can be used to solve problems using operations because by analyzing the units, one can determine whether or not the equation was set up correctly.</td>
<td></td>
</tr>
</tbody>
</table>
| **Example:** Let’s look at a 12-hour shift in a warehouse that operates 50 forklifts. What is the difference between an average driver productivity of 14 pallets per hour and 15 pallets per hour? | | **Basic Steps:**
1. Determine the unit given and the unit needed (answer).
2. Write the number with the unit you are given as a fraction over one on the left hand side and write an equal sign followed by the unit you need on the far right hand side.
3. Multiply by the rates you are given or conversion factors (write as fractions), making sure that the unit that was given in numerator is also on the bottom (denominator) of the given rate or conversion factor.
4. Remember, units cancel out just like numbers do! Continue to multiply by rates or conversion factors until the unit needed is the only unit that does not cancel.
5. Perform the indicated operations. |
| 14 pallets per hour: \[
\frac{50 \text{ lifts}}{1} \times \frac{12 \text{ hrs.}}{1 \text{ shift}} \times \frac{14 \text{ plts.}}{1 \text{ hr.}} = 8,400 \text{ pallets per shift}
\] | **Example:** A snail can crawl 13 feet in 2.5 hours. How far can it crawl in 240 minutes? | |
| 15 pallets per hour: \[
\frac{50 \text{ lifts}}{1} \times \frac{12 \text{ hrs.}}{1 \text{ shift}} \times \frac{15 \text{ plts.}}{1 \text{ hr.}} = 9,000 \text{ pallets per shift}
\] | 1. unit given = 240 minutes, unit needed = feet
2. \[
\frac{240 \text{ min.}}{1} = \text{ feet}
\] 3. \[
\frac{240 \text{ min.}}{1} \times \frac{1 \text{ hr.}}{60 \text{ min.}} \times \frac{13 \text{ ft.}}{2.5 \text{ hrs.}} = \text{ feet}
\] 4. \[
\frac{240 \text{ min.}}{1} \times \frac{1 \text{ hr.}}{60 \text{ min.}} \times \frac{13 \text{ ft.}}{2.5 \text{ hrs.}} = \text{ feet}
\] 5. \[
\frac{240(1)(13)\text{ft.}}{(1)(60)(2.5)} = 20.8\text{ft.}
\] | For this warehouse, an average of 15 pallets per hour means 600 more pallets loaded per day. If we assume the warehouse operates 365 days per year, then the warehouse would load 219,000 more pallets per year. |

Instructor’s Script - Comparing and Contrasting
The eligible content item appears to be similar to CC2.1.HS.F.3 but there is a slight difference. Although this eligible content item can include proportional relationships, because the ratio itself is often a “rate”, this eligible content item includes any operation using a rate or multiple rates and is often more complex.

Common Mistakes Made By Students
Use of incorrect conversion factors or omission of essential conversion factor
For instance, in the problem shown below, a conversion factor (60 minutes = 1 hour) was omitted from the solution.

\[
\text{What is 60 miles per hour in feet per second?}
\]

\[
\begin{align*}
\text{60 miles} & \times \frac{5280 \text{ feet}}{1 \text{ mile}} \times \frac{1 \text{ minute}}{60 \text{ seconds}} \\
\end{align*}
\]

Incorrectly setting up the problem
For instance, in the problem shown below, the problem has been set up incorrectly. Instead of starting with the 60 miles per hour, the solution begins with the conversion factor.

\[
\text{What is 60 miles per hour in feet per second?}
\]

\[
\begin{align*}
\text{1 mile} & \times \frac{1 \text{ hour}}{60 \text{ minutes}} \times \frac{60 \text{ minutes}}{1 \text{ hour}} \times \frac{60 \text{ seconds}}{1 \text{ minute}} = \frac{1}{88} \text{ feet}
\end{align*}
\]

CTE Instructor’s Extended Discussion
Companies keep statistics on the productivity of their forklift drivers. Driver productivity is usually described in terms of pallets per hour. It is very important that students understand that a lack of motivation affects productivity which could affect their job plus the life of the business itself.

The example on the Material Handling/Logistics side of the T-Chart creates interesting opportunities to explore this concept. For instance, let’s assume that it costs the company $1,000/hour to operate these 50 forklifts. With this in mind, how much would it cost the company to load 100,000 pallets if the average driver productivity rate was 15 pallets/hour? 14 pallets/hour?
