## TABLE OF CONTENTS

Glossary of Common Terms ..... 6
Preface: An Overview of the CDT ..... 11
Classroom Diagnostic Tools (CDT) Overview ..... 11
Chapter One: Background of the Classroom Diagnostic Tools ..... 12
The Classroom Diagnostic Tools ..... 12
Key Dates ..... 12
Chapter Two: Test Development Overview of the Pennsylvania CDT Framework ..... 14
Background for the PSSA Assessment Anchors and Eligible Content ..... 14
Background for the Keystone Assessment Anchors and Eligible Content. ..... 15
Diagnostic Categories for the Classroom Diagnostic Tools ..... 17
Chapter Three: General Classroom Diagnostic Tools Test Development Processes ..... 22
Item Development Considerations ..... 23
Item and Test Development Cycle ..... 25
General Item and Test Development Process ..... 27
Chapter Four: Universal Design Procedures Applied to the Classroom Diagnostic Tools Test Development Process ..... 31
Universal Design ..... 31
Elements of Universally Designed Assessments ..... 31
Guidelines for Universally Designed Items ..... 32
Item Development. ..... 33
Item Format ..... 34
Assessment Accommodations ..... 34
Chapter Five: Test Administration Procedures ..... 35
Test Setup ..... 35
PA Online Assessments Software ..... 36
Training and Customer Service Support. ..... 37
Chapter Six: Field Test ..... 39
Field Test Overview ..... 39
CDT Stand-alone Field Tests ..... 40
CDT Embedded Field Tests ..... 44
Statistical Analysis of Item Data ..... 52
Review of Items with Data ..... 53
Differential Item Functioning ..... 61
Chapter Seven: Classical Item Statistics ..... 75
Item-Level Statistics ..... 75
Item Difficulty ..... 75
Item Discrimination ..... 76
Observations and Interpretations ..... 77
Chapter Eight: Rasch Item Calibration ..... 81
Description of the Rasch Model ..... 81
Checking Rasch Assumptions ..... 82
Rasch Item Statistics ..... 107
Chapter Nine: Vertical Linking ..... 108
Vertical Linking Design ..... 108
The Vertical Linking Procedure ..... 113
Vertical Linking Results ..... 115
Banked Item Parameters from Stand-alone Field Tests ..... 119
Banked Item Parameters for the 2019-2020 Operational Item Pools ..... 122
Chapter Ten: Benchmarking ..... 126
Benchmarking Activities ..... 126
Benchmarking Results ..... 127
Chapter Eleven: Scaling ..... 131
Raw Scores to Rasch Ability Estimates ..... 131
Rasch Ability Estimates to Scale Scores ..... 131
Chapter Twelve: Equating ..... 134
Pre-Equating Versus Post-Equating ..... 134
Equating Design for the CDT ..... 135
Evaluation of Item Parameter Stability ..... 135
Equating Additional Field-Test Items ..... 135
Chapter Thirteen: Operational Test Design and CAT Configurations ..... 136
Operational Test Design ..... 136
CAT Algorithm ..... 139
CAT Configuration - Math Grades 6-HS ..... 148
CAT Configuration - Algebra I ..... 148
CAT Configuration - Geometry ..... 149
CAT Configuration - Algebra II ..... 149
CAT Configuration - Math Grades 3-5 ..... 150
CAT Configuration - Reading/Lit Grades 6-HS ..... 150
CAT Configuration - Reading Grades 3-5 ..... 151
CAT Configuration - Science Grades 6-HS ..... 152
CAT Configuration - Biology ..... 153
CAT Configuration - Chemistry ..... 153
CAT Configuration - Science Grades 3-5 ..... 154
CAT Configuration - Writing/Eng Comp Grades 6-HS. ..... 154
CAT Configuration - Writing Grades 3-5 ..... 155
Chapter Fourteen: Scores and Score Reports ..... 159
Accessing Interactive Reports ..... 159
Group Map ..... 159
Individual Map ..... 159
Group and Individual Learning Progression Map ..... 160
Group Learning Progression Map. ..... 160
Chapter Fifteen: Operational Administration 2019-2020 ..... 161
Frequencies ..... 161
Demographic Characteristics ..... 169
Summary Statistics-Test Length ..... 183
Summary Statistics-Scale Scores and Conditional Standard Errors ..... 187
Summary Statistics - Scale Scores and Conditional Standard Errors for Diagnostic Category Sub-Scores From Full CDT ..... 213
Diagnostic Category Score Differences ..... 227
Distribution of Benchmark Ranges ..... 244
Multiple Administrations of the Same CDT Test ..... 246
Chapter Sixteen: Reliability ..... 250
Reliability Indices ..... 250
Coefficient Alpha ..... 251
Split-Half Reliability ..... 252
Further Interpretations ..... 252
Standard Error of Measurement ..... 253
Results and Observations ..... 255
Rasch Conditional Standard Errors of Measurement ..... 258
Results and Observations ..... 259
Decision Consistency ..... 266
Chapter Seventeen: Validity ..... 272
Purposes and Intended Uses of the CDT ..... 272
Evidence Based on Test Content ..... 272
Evidence Based on Response Process ..... 274
Evidence Based on Internal Structure ..... 274
Evidence Based on Relationships with Other Variables ..... 289
Evidence Based on Consequences of Tests ..... 293
Evidence Related to Use of the Rasch Model ..... 294
Validity Evidence Summary ..... 294
Chapter Eighteen: Parameter Stability ..... 295
Methodology ..... 295
Anchored Concurrent Calibration within Content Area across Grades/Courses ..... 295
Anchored Grade Level Calibrations ..... 324
Chapter Nineteen: Revision of Benchmark Cuts ..... 350
First Revision of Benchnark Cuts Based on Operational Data ..... 350
Extrapolation of Benchmark Cuts for Grades 2 Through 4 ..... 351
Revision of Benchmark Cuts Based on Changes to PSSA ..... 352
Benchmark Cuts for All Grades and Courses for the 2019-2020 School Year ..... 353
Appendix A: General Development and Field Test Cycle for the Classroom Diagnostic Tools ..... 355
Appendix B: Field Test Item Statistics ..... 358
Mathematics Multiple-Choice Items ..... 358
Reading/Literature Multiple-Choice Items ..... 358
Science Multiple-Choice Items. ..... 358
Writing/English Composition Multiple-Choice Items ..... 358
Reading/Literature Evidence-Based Selected-Response Items ..... 358
Science technology-enchanced Items ..... 359
Appendix C: Vertical Linking Item Details ..... 364
Mathematics .....  364
Reading/Literature ..... 389
Science ..... 407
Writing/English Composition ..... 428
Appendix D: Significant Differences Among Diagnostic Categories ..... 441
Diagnostic Category Significant Differences ..... 441
Appendix E: Decision Consistency ..... 450
3 X 3 Retest Classification Probability ..... 450
Appendix F: CDT Learning Progressions ..... 492
Appendix G: Development of the Pennsylvania Academic Standards, Assessment Anchor Content Standards, and Eligible Content ..... 493
Development of the Assessment Anchor Content Standards and the Eligible Content Statements ..... 493
Follow-up Meetings with the Quality Review Team and PDE ..... 495
Pennsylvania Board of Education Approval ..... 495
Appendix H: CDT Passage Development Process ..... 496
Quantitative Evaluation ..... 496
Qualitative Evaluation ..... 496
Text Complexity: Qualitative-Measures Rubric-Literary Texts ..... 496
Appendix I: Depth of Knowledge ..... 500
Appendix J: Operational Administration 2019-2020 After School Closure ..... 519
Making CDT Available Away From School ..... 519
Frequencies ..... 519
References ..... 524

## GLOSSARY OF COMMON TERMS

The following table contains some terms used in this technical report and their meanings. Some of these terms are used universally in the assessment community, and some of these terms are used commonly by psychometric professionals.

| Term | Common Definition |
| :---: | :---: |
| Ability | In Rasch scaling, ability is a generic term indicating the level of an individual on the construct measured by an exam. As an example, for the CDT, a student's reading ability is measured by how the student performed on the CDT Reading/Literature test. |
| Alternative Forms | Alternative forms are two or more versions of a test that are considered exchangeable; for example, they measure the same constructs in the same ways, are intended for the same purposes, and are administered using the same directions. More specific terminology applies depending on the degree of statistical similarity between the test forms (e.g., parallel forms, equivalent forms, comparable forms), where parallel forms refers to the situation in which the test forms have the highest degree of similarity to each other. |
| Average | Average is a measure of central tendency in a score distribution that usually refers to the arithmetic mean of a set of scores. In this case, it is determined by adding all the scores in a distribution and then dividing the obtained value by the total number of scores. Sometimes people use the word average to refer to other measures of central tendency such as the median (the score in the middle of a distribution) or mode (the score value with the greatest frequency). |
| Benchmark Activity | Also referred to as benchmarking, benchmark activity is a procedure used in the determination of the cut score(s) for a given assessment. It is used to measure students' progress towards certain performance standards. Methods vary (e.g., modified Angoff, Bookmark Method), but most use a panel of educators and expert judgments to operationalize the level of achievement students must demonstrate in order to be categorized within each performance level. |
| Benchmark Cut | A benchmark cut marks a specified point on a score scale where scores at or above that point are interpreted differently from scores below that point (e.g., a score designated as the minimum level of performance needed to pass a competency test). A test can be divided into multiple proficiency levels by setting one or more cut scores. Methods for establishing cut scores vary. For the CDT, one benchmark cut was set that separates students into two categories: solidly ready for the next grade or course and not solidly ready for the next grade or course. |
| Bias | In a statistical context, bias refers to any source of systematic error in the measurement of a test score. In discussing test fairness, bias may refer to construct-irrelevant components of test scores that differentially affect the performance of different groups of test takers (e.g., gender, ethnicity). Attempts are made to reduce bias by conducting item fairness reviews and various differential item functioning (DIF) analyses, detecting potential areas of concern, and either removing or revising the flagged test items prior to including them in the final operational pools (see also Differential Item Functioning). |
| Computer Adaptive Test (CAT) | A computer adaptive test (CAT) is a computer-based test with an item selection routine that adjusts (adapts) to a student's performance during the test. For this reason, it has also been called a tailored test. Rather than all students taking the same set of items (fixed form), each student's test is individually tailored with items selected from a large item pool based on the student's performance. |
| Constructed-Response Item | A constructed-response item—referred to by some as an open-ended response item-is an item format that requires examinees to create their own responses, which can be expressed in various forms. This format is in contrast to multiple-choice items, which require students to make a choice from a supplied set of answer options. There are no constructed-response items on the CDT. |
| Content Validity Evidence | Content validity evidence shows the extent to which an exam provides an appropriate sampling of a content domain of interest (e.g., assessable portions of a state's grade 6 mathematics curriculum in terms of the knowledge, skills, objectives, and processes sampled). |
| Criterion-Referenced Interpretation | The criterion-referenced interpretation is a measure of a student's performance against an expected level of mastery, educational objective, or standard. The types of resulting score interpretations provide information about what a student knows or can do in a given content area. |

| Term | Common Definition |
| :---: | :---: |
| Decision Consistency | Decision consistency is the extent to which classifications based on test scores would match the decisions on students' proficiency levels based on scores from a second parallel form of the same test. It is often expressed as the proportion of examinees who are classified the same way from the two test administrations. |
| Diagnostic Category | A diagnostic category is a grouping used for reporting results on the CDT. Each CDT test has four or five diagnostic categories which are based on the Pennsylvania Academic Standards (Mathematics, Reading, and Writing) or the Pennsylvania Academic Standards (Science). |
| Differential Item <br> Functioning (DIF) | Differential item functioning (DIF) is a statistical property of a test item in which different groups of test takers (who have the same total test score) have different average item scores. In other words, students with the same ability level but different group memberships do not have the same probability of answering the item correctly (see also Bias). |
| Distractor | A distractor is an incorrect option in a multiple-choice item (also called a foil). |
| Equating | The process that results in scores that can be used interchangeably across different test forms and/or test administrations. Equated test scores are considered exchangeable. Consequently, the requirements for equating are strong and somewhat complex (equal construct and precision, equity, and invariance). In practical terms, it is often stated that students should perceive no differences regardless of the test form administered (see also Scale Linking, Pre-equating, and Post-equating). |
| Evidence-Based <br> Selected-Response Item | A type of item that has two parts and requires the test taker to select a response from a group of possible answer choices in Part One, one of which is the correct answer (or key) to the question posed, and to then select one or two responses from a group of possible answer choices in Part Two, which provide evidence to support the correct answer in Part One. |
| Field-Test item | A field-test item is a newly developed item that is ready to be tried out to determine its statistical properties (e.g., see $p$-value and Point-Biserial Correlation). Items are field tested prior to operational administration. Items with acceptable statistical properties in field-test form the pool of CDT operational items. |
| Frequency | Frequency is the number of times that a certain value or range of values (score interval) occurs in a distribution of scores. |
| Frequency Distribution | Frequency distribution is a tabulation of scores from low to high or high to low with the number and/or percent of individuals who obtain each score or who fall within each score interval. |
| Infit/Outfit | Infit and outfit are statistical indicators of the agreement of the data and the measurement model. Infit and outfit are highly correlated, and they both are highly correlated with the point-biserial correlation. Underfit can be caused when low-ability students correctly answer difficult items (perhaps by guessing or atypical experience) or high-ability students incorrectly answer easy items (perhaps because of carelessness or gaps in instruction). Any model expects some level of variability, so overfit can occur when nearly all low-ability students miss an item while nearly all high-ability students get the item correct. |
| Item Difficulty | For the Rasch model, the dichotomous item difficulty represents the point along the latent trait continuum where an examinee has a 0.50 probability of making a correct response. |
| Key | The key is the correct response option or answer to a test item. |
| Learning Progression | A learning progression shows the developmental sequences or building blocks of content/skills students need to master as they progress toward career and college readiness and is tied directly to the Assessment Anchors and Eligible Content as well as the Voluntary Model Curriculum Units and Lesson Plans. |
| Linking | A generic term referring to a number of processes by which scores from one or more tests are made comparable to some degree. Linking includes several classes of transformations (equating, scale alignment, prediction, etc.). Equating is associated with the strongest degree of comparability (exchangeable scores). Other linkages may be very strong but fail to meet one or more of the strict criteria required of equating (see also Equating). CDT scores are equated. |
| Logit | In Rasch scaling, logits are units used to express both examinee ability and item difficulty. When expressing examinee ability, if two students take the same set of items, a student who answers more items correctly has a higher logit than a student who answers fewer items correctly. Logits are transformed into scale scores through a linear transformation. When expressing item difficulty, logits are transformed $p$-value (see also $P$-value). The logit difficulty scale is inversely related to $p$-values. A higher logit value would represent a relatively harder item, while a lower logit value would represent a relatively easier item. |

| Term | Common Definition |
| :---: | :---: |
| Mean | Mean is also referred to as the arithmetic mean of a set of scores. It is found by adding all the score values in a distribution and dividing by the total number of scores. For example, the mean of the set $\{66,76,85$, and 97$\}$ is 81. The value of a mean can be influenced by extreme values in a score distribution. |
| Measure | In Rasch scaling, measure generally refers to a specific estimate of an examinee's ability (often expressed as logits) or an item's difficulty (again, often expressed as logits). As an example, for the CDT, a student's literature measure might be equal to 0.525 logit. Or, a CDT literature test item might have a logit equal to -0.905. |
| Median | The median is the middle point or score in a set of rank-ordered observations that divides the distribution into two equal parts; each part contains 50 percent of the total data set. More simply put, half of the scores are below the median value and half of the scores are above the median value. As an example, the median for the following ranked set of scores $\{2,3,6,8,9\}$ is 6 . |
| Multiple-Choice Item | A multiple-choice item is a type of item format that requires the test taker to select a response from a group of possible choices, one of which is the correct answer (or key) to the question posed. All items on the CDT are multiple-choice items. |
| $N$-count | Sometimes designated as $N$ or $n$, it is the number of observations (usually individuals or students) in a particular group. Some examples include the number of students tested, the number of students tested from a specific subpopulation (e.g., females), and the number of students who attained a specific score. In the following set $\{23,32,56,65,78,87\}, n=6$. |
| Operational Item | After initial item tryout (field test), all items with acceptable statistical properties form the pool of CDT operational items. Students' tests are selected from this pool. |
| Percent Correct | When referring to an individual item, the percent correct is the item's $p$-value from the field test administration expressed as a percent (instead of a proportion). Under a computer adaptive administration, percent correct scores are not appropriate for individual items or students. |
| Percentile | Percentile is the score or point in a score distribution at or below which a given percentage of scores fall. It should be emphasized that it is a value on the score scale, not the associated percentage (although sometimes in casual usage this misinterpretation is made). For example, if 72 percent of the students score at or below a scale score of 1500 on a given test, then the scale score of 1500 would be considered the 72 nd percentile. As another example, the median is the 50th percentile. |
| Percentile Rank | The percentile rank is the percentage of scores in a specified distribution that fall at/below a certain point on a score distribution. Percentile ranks range in value from 1 to 99 . They indicate the status or relative standing of an individual within a specified group by indicating the percent of individuals in that group who obtained equal or lower scores. An individual's percentile rank can vary depending on which group is used to determine the ranking. As suggested above, percentiles and percentile ranks are sometimes used interchangeably; however, strictly speaking, a percentile is a value on the score scale. |
| Point-Biserial Correlation | In classical test theory, point-biserial correlation is an item discrimination index. It is the correlation between a dichotomously scored item and a continuous criterion, usually represented by the total test score (or the corrected total test score with the reference item removed). It reflects the extent to which an item differentiates between high-scoring and low-scoring examinees. This discrimination index ranges from -1.00 to +1.00 . The higher the discrimination index (the closer to +1.00 ), the better the item is considered to be performing. For multiple-choice items scored as 0 or 1 , it is rare for the value of this index to exceed 0.5 . |
| Post-Equating | Post-equating refers to the method of utilizing data from the current administration for scale linking and equating. Post-equating relies heavily on collecting data from a representative sample, estimating new item parameters, linking the item parameters to the base sale, and estimating student ability based on the linked item parameters. In order to provide immediate results, CDT utilizes pre-equating. Post-equating is conducted for field-test analyses and updating item parameters. |
| Pre-Equating | Pre-equating refers to the method of utilizing previously estimated and linked item parameters for equating. Because item parameters have already been linked to the base scale, pre-equated solutions are available immediately after a CDT is completed. |

| Term | Common Definition |
| :---: | :---: |
| $P$-value | A $p$-value is an index indicating an item's difficulty for some specified group (perhaps grade). It is calculated as the proportion (sometimes percent) of students in the group who answer an item correctly. $P$-values range from 0.0 to 1.0 on the proportion scale. Lower values correspond to more difficult items and higher values correspond to easier items. $P$-values are usually provided for multiple-choice items or other items worth one point. For open-ended items or items worth more than one point, difficulty on a $p$-value-like scale can be estimated by dividing the item mean score by the maximum number of points possible for the item (see also Logit). |
| Raw Score | Raw score is an unadjusted score usually determined by tallying the number of questions answered correctly or by the sum of item scores (i.e., points). Raw scores typically have little or no meaning by themselves and require additional information like the number of items on the test and the difficulty of the test items. Under a computer adaptive administration, where each student takes a unique set of items, raw scores are not comparable across students. |
| Reliability | Reliability is the expected degree to which test scores for a group of examinees are consistent over exchangeable replications of an assessment procedure and, therefore, considered dependable and repeatable for an individual examinee. A test that produces highly consistent, stable results (i.e., relatively free from random error) is said to be highly reliable. The reliability of a test is typically expressed as a reliability coefficient or by the standard error of measurement derived by that coefficient. |
| Reliability Coefficient | Reliability coefficient is a statistical index that reflects the degree to which scores are free from random measurement error. Theoretically, it expresses the consistency of test scores as the ratio of true score variance to total score variance (true score variance plus error variance). This statistic is often expressed as a correlation coefficient (e.g., correlation between two forms of a test) or with an index that resembles a correlation coefficient (e.g., calculation of a test's internal consistency using coefficient alpha). Expressed this way, the reliability coefficient is a "unitless" index. The higher the value of the index (closer to 1.0), the greater the reliability of the test (see also Standard Error of Measurement). |
| Scale Linking | The first step in any equating process in which independent item estimates are placed on the same scale of measurement (the logit scale). Scale linking results in item parameters that are on the same scale of measurement. Equating procedures can only be implemented once scale linking is achieved (see also Equating). |
| Scale Score | Scale score is a mathematical transformation of a Rasch ability estimate developed through a process called scaling. Scale scores are most useful when comparing test results over time. Several different methods of scaling exist, but each is intended to provide a continuous and meaningful score scale across different forms of a test. |
| Standard Deviation | Standard deviation is a statistic that measures the degree of spread or dispersion of a set of scores. The value of this statistic is always greater than or equal to zero. If all of the scores in a distribution are identical, the standard deviation is equal to zero. The further the scores are away from one another in value, the greater the standard deviation. This statistic is calculated using the information about the deviations (distances) between each score and the distribution's mean. It is equivalent to the square root of the variance statistic. The standard deviation is a commonly used method of examining a distribution's variability since the standard deviation is expressed in the same units as the data. |
| Standard Error of Measurement (SEM) | Standard error of measurement (SEM) is the amount an observed score is expected to fluctuate around the true score. As an example, across replications of a measurement procedure, the true score will not differ by more than plus or minus one standard error from the observed score about 68 percent of the time (assuming normally distributed errors). The SEM is frequently used to obtain an idea of the consistency of a person's score in actual score units, or to set a confidence band around a score in terms of the error of measurement. Often a single SEM value is calculated for all test scores. On other occasions, however, the value of the SEM can vary along a score scale. Conditional standard error of measurement (CSEM) also indicates the degree of measurement error in scale score units but varies as a function of a student's unique set of items and actual scale score. |
| Step Difficulty | Step difficulty is a parameter estimate in Master's Partial Credit Model (PCM) that represents the relative difficulty of each score step (e.g., going from a score of 1 to a score of 2). The higher the value of a particular step difficulty, the more difficult a particular step is relative to other score steps (e.g., is it harder to go from a 1 to a 2 , or to go from a 2 to a 3). |

| Term | Common Definition |
| :--- | :--- |
| Technical Advisory <br> Committee (TAC) | The technical advisory committee (TAC) is a group of individuals (most often professionals in the field of <br> testing) that are either appointed or selected to make recommendations for and to guide the technical <br> development of a given testing program. |
| Technology Enhanced <br> (TE) Items | Technology Enhanced (TE) items are items that capitalize on computer-based interactions for <br> collecting response data. Examples of TE items include drop-down menus, drag and drop <br> functionality, text highlighting, and other interactions. |
| Validity | Validity is the degree to which accumulated evidence and theory support specific interpretations of test scores <br> entailed by the purpose of a test. There are various ways of gathering validity evidence. |

## PREFACE: AN OVERVIEW OF THE CDT

## CLASSROOM DIAGNOSTIC TOOLS (CDT) OVERVIEW

The Pennsylvania Classroom Diagnostic Tools (CDT) is a set of online assessments, divided by content area, designed to provide diagnostic information in order to guide instruction and remediation. The CDT reporting system is fully integrated in Pennsylvania's Standards Aligned System (SAS). It assists educators in identifying student academic strengths and areas in need of improvement by providing links to classroom resources. The diagnostic reports feature easy-to-follow links to targeted curricular resources and materials, including units and lesson plans found within the SAS system. Students in grades 3 through high school at all Pennsylvania schools may take the CDT up to five times throughout the school year at no cost.

The purpose of the CDT is to provide information that will help guide instruction by providing support to students and teachers. The CDT reports are designed to provide a picture or snapshot of how students are performing in relation to the Pennsylvania Assessment Anchors and Eligible Content and Keystone Assessment Anchors and Eligible Content. The CDT goes beyond focusing only on What students should know and be able to do at a particular grade and/or course. It also provides a snapshot of How and Why students may still be struggling or extending beyond the grade and/or course Eligible Content. This valuable information is typically not identified through other types of assessments. Teachers, through the use of the CDT reports, may access additional information through the Learning Progression Map. The Learning Progression Map allows teachers to pinpoint where students are struggling or where they are extending beyond the learning continuum. The CDT helps identify and provides suggestions for next steps in student academic development.

The CDT consists of only multiple-choice questions and evidence-based selected response questions. The questions were developed to specifically align to the Pennsylvania Assessment Anchors and Eligible Content at kindergarten through high school and the Keystone Assessment Anchors and Eligible Content for end-of-course. The CDT is based on content assessed by the Pennsylvania System of School Assessments (PSSA) and the Keystone Exams. It includes interactive and dynamic reporting for various diagnostic reporting categories.

## CDT Activities for the 2019-2020 School Year

| Description | Date |
| :--- | :--- |
| Test Setup System Available | August 12, 2019 |
| First Day of Testing | August 19, 2019 |
| Last Day of Testing | August 14, 2020 |

## CHAPTER ONE: BACKGROUND OF THE CLASSROOM DIAGNOSTIC TOOLS

This brief overview of the Pennsylvania Classroom Diagnostic Tools summarizes the program's intent and purpose, as well as key dates in the development process.

## THE CLASSROOM DIAGNOSTIC TOOLS

The Classroom Diagnostic Tools (CDT) is a set of online assessments, divided by content area, designed to provide diagnostic information in order to a guide instruction and enrichment. The CDT reporting system is fully integrated in the Standards Aligned System (SAS). It assists educators in identifying student academic strengths and areas in need of improvement by providing links to classroom resources. The diagnostic reports feature easy-to-follow links to targeted curricular resources and materials, including units and lesson plans found within the SAS system. The CDT is available to districts at no cost.

The CDT is:

- Offered to students in grades 3 through high school
- Available for use in the classroom throughout the school year on a voluntary basis
- Based on content assessed by the Keystone Exams and the Pennsylvania System of School Assessment (PSSA)
- Comprised of multiple-choice items (all content areas), and evidence-based selected-response items (in Reading and Literature only)
- Delivered as an online Computer Adaptive Test (CAT), ensuring valid and reliable measures of a student's skills while minimizing testing time
- Designed to provide real-time results for students and teachers with links to Materials and Resources in SAS
- Available for Mathematics Lower Grades ${ }^{1}$, Mathematics, Algebra I, Geometry, Algebra II, Reading Lower Grades, Reading/Literature, Science Lower Grades, Science, Biology, Chemistry, Writing Lower Grades, and Writing/English Composition
- Available as Full CDT which covers multiple diagnostic categories or as Diagnostic Category CDT which covers a single category.

## KEY DATES

The items for each course of the CDT were field tested online using fixed-form computer-based tests prior to their use in operational computer adaptive tests. Additional items were field tested as items embedded within the operational CDT to increase the pool of items aligned to the Pennsylvania Core Standards and to allow the extension of the CDT to students in grades 3 through 5. The timeline for implementation of the field tests and operational availability is shown in the following table.

[^0]Table 1-1. Key Dates

| Course | Field Test <br> Dates | Operational <br> Rollout Dates |
| :--- | :--- | :--- |
| Mathematics, Algebra I, Geometry, Algebra II | Spring 2010 | Fall 2010 |
| Reading/Literature | Fall 2010 | Spring 2011 |
| Science, Biology, Chemistry | Fall 2010 | Spring 2011 |
| Writing/English Composition | Spring 2011 | Fall 2011 |
| Mathematics, Reading/Literature, and Writing/English Composition aligned to the Pennsylvania Core <br> Standards |  |  |
| Mathematics Lower Grades, Reading Lower Grades, Science Lower Grades, and Writing Lower <br> Grades | Fall 2013 2013 | Fall 2013 |
| Mathematics, Algebra I, Algebra II, Reading, Literature, Writing, English Composition, Science, <br> Biology, and Chemistry | Fall 2018 | Spring 2014 |
| Science and Biology | Spring 2019 | Spring 2020 |

For more details on field-test events, see Chapter Six.

[^1]
## CHAPTER TWO: TEST DEVELOPMENT OVERVIEW OF THE PENNSYLVANIA CDT FRAMEWORK

The Pennsylvania Classroom Diagnostic Tools (CDT) is available for Mathematics Lower Grades, Mathematics, Algebra I, Geometry, Algebra II, Reading Lower Grades, Reading/Literature, Science Lower Grades, Science, Biology, Chemistry, Writing Lower Grades, and Writing/English Composition for students in grades 3 through high school. The assessments are administered online in a computer adaptive test (CAT) format.

The Pennsylvania CDT consists of multiple-choice, evidence-based selected-response, and technology-enhanced, questions that align to the Pennsylvania Assessment Anchors and Eligible Content at grades 3 through high school for mathematics, reading, writing, and science and the Keystone Assessment Anchors and Eligible Content for end-of-course for Algebra I, Algebra II, Geometry, Literature, English Composition, Biology, and Chemistry and evidence-based selected-response questions that align to the Pennsylvania Assessment Anchors and Eligible Content at grade 3 through 8 for reading. With the exception of grades 3, 5, 6, and 7 for Science, these Pennsylvania Assessment Anchors and Eligible Content were developed previously for the PSSA and Keystone Exams as described in the following sections. In addition, Learning Progressions were developed to show the pathways along which students travel as they progress towards mastery of the skills in each content area.

## BACKGROUND FOR THE PSSA ASSESSMENT ANCHORS AND ELIGIBLE CONTENT

The PSSA Assessment Anchor Content Standards and Eligible Content in Mathematics, Reading, and Writing are based on the Pennsylvania Core Standards. The PSSA Assessment Anchor Content Standards and Eligible Content in Science are based on the Pennsylvania Academic Standards. Although the Pennsylvania Core Standards and the Pennsylvania Academic Standards indicate what students should know and be able to do, educator concerns regarding the number and breadth of Academic Standards led to an initiative by the Pennsylvania Department of Education (PDE) to develop Assessment Anchor Content Standards (Assessment Anchors) to indicate which parts of the Academic Standards (Instructional Standards) would be assessed on the PSSA. Based on recommendations from Pennsylvania educators, the Assessment Anchors were designed as a tool to improve the articulation of curricular, instructional, and assessment practices. The Assessment Anchors clarify what is expected across each grade span and focus the content of the standards into what is assessable on a large-scale test. The Assessment Anchor documents also serve to communicate Eligible Content, also called assessment limits, or the range of knowledge and skills from which the PSSA would be designed.

The Assessment Anchor's coding is read like an outline. The coding includes the content, grade level, Reporting Category, Assessment Anchor, descriptor (Sub-Assessment Anchor), and Eligible Content. Thus, S.4.A.1.3.1 would be Science, Grade 4, Reporting Category A, Assessment Anchor 1, descriptor (Sub-Assessment Anchor) 3, and Eligible Content 1.

Each of the Assessment Anchors has one or more descriptors (Sub-Assessment Anchors) and Eligible Content varying to reflect grade-level appropriateness. The Assessment Anchors form the basis of the test design for the grades undergoing new test development. In turn, this hierarchy is the basis for organizing the total content scores (based on the core [common] sections).

With Pennsylvania's decision to adopt the Pennsylvania Core Standards based on the Common Core State Standards, committees of Pennsylvania educators met in October 2011 to write, review, and approve the Assessment Anchors and Eligible Content statements. To provide initial focus, each content and grade span committee was presented with materials specific to the content and grade span in question, including a basic blueprint structure, the Pennsylvania Academic Standards, the Pennsylvania Assessment Anchors and Eligible Content aligned to the Pennsylvania Academic Standards, the Common Core State Standards, and draft Eligible Content statements. Committees then completed an iterative process of reviewing and revising the draft Eligible Content statements followed by discussions across grade-span committees to ensure vertical articulation across the grades. The results from the committee work were evaluated by national, state, and local subject matter experts, and, following revisions, they were ultimately validated by another committee of Pennsylvania educators. Following committee approval, the Pennsylvania Core Standards-aligned Assessment Anchors and Eligible Content for English Language Arts and Mathematics were approved by the State Board of Education in September 2013.

The complete set of Assessment Anchors and Eligible Content can be referenced at PDE's website: www.education.pa.gov.

- Roll over 'Data and Reporting' in the bar across the top of the page.
- Select `Assessment and Accountability.' Click on the link that reads `PSSA - PA System of School Assessment'. Then click on Assessment Anchors/Eligible Content

For Science, Assessment Anchors and Eligible Content had only been previously developed at grades 4, 8, and 11 for the PSSA and for the Biology and Chemistry Keystone Exams. Therefore, to provide a vertical articulation of science content from grade to grade, a group of Pennsylvania educators were brought together to develop Assessment Anchors and Eligible Content for the off grades (those that do not assess Science on the PSSA). These educators, in collaboration with DRC Science Test Development staff, used the Assessment Anchors and Eligible Content for grades 4, 8, and 11 as the foundation to develop Assessment Anchors and Eligible Content for grades $3,5,6$, and 7 .

With the extension of the CDT to allow students in grades 3 through 5 to participate in the assessments, it was necessary to include items appropriate to assess skills and understandings that students should learn in kindergarten through grade 2. For Mathematics, Reading, and Writing, test questions were developed based to align to the Pennsylvania Core Standards for grades K through 2. For Science, a group of Pennsylvania educators was brought together in March 2013 to develop the Science Grades K-2 Assessment Anchors and Eligible Content, which are organized as a single grade band and contain foundational science concepts in order to promote flexibility in classroom instruction for these early grade levels.

## BACKGROUND FOR THE KEYSTONE ASSESSMENT ANCHORS AND ELIGIBLE CONTENT

The Keystone Test Blueprints—known as the Keystone Assessment Anchors and Eligible Content—are based on Pennsylvania Keystone Course Standards and the Common Core State Standards. Prior to the development of the Assessment Anchors, multiple groups of Pennsylvania educators convened to create a set of standards for each of the Keystone Exams. Derived from a review of existing standards, these Enhanced Standards (Course Standards) focus on what students need to know and be able to do in order to be college and career ready.

Although the Keystone Course Standards indicate what students should know and be able to do, Assessment Anchors are designed to indicate which parts of the Keystone Course Standards (Instructional Standards) will be assessed on the Keystone Exams. Based on recommendations from Pennsylvania educators, the Assessment Anchors were designed as a tool to improve the articulation of curricular, instructional, and assessment practices. The Assessment Anchors clarify what is expected and focus the content of the standards into what is assessable on a large-scale exam. The Assessment Anchor documents also serve to communicate Eligible Content, or the range of knowledge and skills from which the Keystone Exams are designed.

The Keystone Assessment Anchors and Eligible Content have been designed to hold together or anchor the state assessment system and curriculum/instructional practices in schools following these design parameters:

- Clear: The Assessment Anchors are easy to read and are user-friendly; they clearly detail which standards are assessed on the Keystone Exams.
- Focused: The Assessment Anchors identify a core set of standards that could be reasonably assessed on a large-scale assessment, which will keep educators from having to guess which standards are critical.
- Rigorous: The Assessment Anchors support the rigor of the state standards by assessing higher order and reasoning skills.
- Manageable: The Assessment Anchors define the standards in a way that can be easily incorporated into a course to prepare students for success.

The Assessment Anchors and Eligible Content are organized into cohesive blueprints, each structured with a common labeling system. This framework is organized first by Module (Reporting Category), then by Assessment Anchor, followed by Anchor Descriptor, and then finally, at the greatest level of detail, by an Eligible Content statement. The common format of this outline is followed across the Keystone Exams.

Here is a description of each level in the labeling system for the Keystone Exams.

- Module: The Assessment Anchors are organized into two thematic modules for each of the Keystone Exams, and these modules serve as the Reporting Categories for the Keystone Exams. The Module title appears at the top of each page in the Assessment Anchor document. The Module level is also important because the Keystone Exams are built using a Module format, with each of the Keystone Exams divided into two equally sized test modules. Each Module is made up of two or more Assessment Anchors.
- Assessment Anchor: The Assessment Anchor appears in the shaded bar across the top of each Assessment Anchor table in the Assessment Anchor document. The Assessment Anchors represent categories of subject matter that anchor the content of the Keystone Exams. Each Assessment Anchor is part of a Module and has one or more Anchor Descriptors unified under it.
- Anchor Descriptor: Below each Assessment Anchor in the Assessment Anchor document is a specific Anchor Descriptor. The Anchor Descriptor level provides further details that delineate the scope of content covered by the Assessment Anchor. Each Anchor Descriptor is part of an Assessment Anchor and has one or more Eligible Content statements unified under it.
- Eligible Content: The column to the right of the Anchor Descriptor in the Assessment Anchor document contains the Eligible Content statements. The Eligible Content is the most specific description of the content that is assessed on the Keystone Exams. This level is considered the assessment limit and helps educators identify the range of content covered on the Keystone Exams.
- Enhanced Standard: In the column to the right of each Eligible Content statement is a code representing one or more Enhanced Standards that correlate to the Eligible Content statement. Some Eligible Content statements include annotations that indicate certain clarifications about the scope of an Eligible Content.
- Notes: There are three types of notes included in the Assessment Anchor document:
"e.g." ("for example")—sample approach, but not a limit to the Eligible Content
"i.e." ("that is")-specific limit to the Eligible Content "Note"-content exclusions or definable range of the Eligible Content

The Assessment Anchor's coding is read like an outline. The coding includes the Subject (Exam), Reporting Category/Module, Assessment Anchor, Anchor Descriptor, and Eligible Content. Each exam has two modules. Each Module has two or more Assessment Anchors. Each of the Assessment Anchors has one or more Anchor Descriptors, and each Anchor Descriptor has at least one Eligible Content statements (generally more than one). The Assessment Anchors form the basis of the test design for the exams undergoing test development. In turn, this hierarchy is the basis for organizing the total Module and exam scores.

Table 2-1. Sample Keystone Assessment Anchor Coding

| Sample Code | Subject <br> (Exam) | Reporting Gategory (Module) | Assessment <br> Anchor (AA) | Anchor Descriptor (AD) | Eligible Content (EC) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| A1.1.1.2.1 | A1-Algebra I | 1-Operations and Linear Equations \& Inequalities | $\begin{array}{\|l\|} \hline 1 \text { - Linear } \\ \text { Equations } \end{array}$ | 2 - Write, solve, and/or graph linear equations using various methods. | 1 - Write, solve, and/or apply a linear equation (including problem situations). |
| BIO.A.2.1.1 | BIO -Biology | A - Cells and Cell Processes | 2 -The <br> Chemical Basis <br> for Life | 1 - Describe how the unique properties of water support life on Earth. | 1 - Describe the unique properties of water and how these properties support life on Earth (e.g., freezing point, high specific heat, cohesion). |
| L.F.2.4.1 | L-Literature | F-Fiction | 2 - Analyzing and Interpreting LiteratureFiction | 4 - Use appropriate strategies to interpret and analyze the universal significance of literary fiction. | 1 - Interpret and analyze works from a variety of genres for literary, historical, and/or cultural significance. |

The complete set of Assessment Anchors and Eligible Content can be referenced at PDE's Standards Aligned System (SAS) website at http://www.pdesas.org/Standard. Assessment Anchors and Eligible Content for Grades 3-8 can be found by selecting "Download PSSA and PASA Anchors and Eligible Content" while Assessment Anchors and Eligible Content for high school courses can be found by selecting "Download Keystone Anchors."

## DIAGNOSTIC CATEGORIES FOR THE CLASSROOM DIAGNOSTIC TOOLS

The Classroom Diagnostic Tools provide information for teachers, students, and other stakeholders regarding student performance at the Overall Score level and also for each diagnostic category within the selected assessment. These diagnostic categories provide more detailed information about student strengths and areas of need for a related group of Eligible Content. A description of the diagnostic categories for each assessment follows.

## MATHEMATICS LOWER GRADES AND MATHEMATICS

There are four diagnostic categories for the mathematics assessments. These are Numbers \& Operations, Algebraic Concepts, Geometry, and Measurement, Data, and Probability. The number of Eligible Content from each grade that map to these diagnostic categories is shown in the table below.

Table 2-2. Number of Eligible Content per Diagnostic Category by Grade for Mathematics Lower Grades and Mathematics

| Diagnostic Gategory | Kindergarten* | Grade 1* | Grade 2* | Grade 3 | Grade 4 | Grade 5 | Grade 6 | Grade 7 | Grade 8 | HS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Numbers \& Operations | 1 | 3 | 3 | 9 | 20 | 13 | 15 | 9 | 5 | 6 |
| Algebraic Concepts | 1 | 2 | 3 | 14 | 8 | 4 | 11 | 5 | 17 | 46 |
| Geometry | 2 | 2 | 2 | 3 | 3 | 3 | 6 | 8 | 8 | 29 |
| Measurement, Data, and Probability | 2 | 3 | 5 | 15 | 9 | 5 | 4 | 7 | 4 | 12 |

[^2]
## ALGEBRA I

The Keystone Algebra I Assessment Anchors and Eligible Content has two reporting categories: Module 1, Operations and Linear Equations \& Inequalities, and Module 2, Linear Functions and Data Organizations. These modules are each divided into two diagnostic categories. Module 1 is divided into Operations with Real Numbers and Expressions and Linear Equations \& Inequalities. Module 2 is divided into Functions \& Coordinate Geometry and Data Analysis. The number of Eligible Content from each grade that map to these diagnostic categories is shown in the following table.

Table 2-3. Number of Eligible Content per Diagnostic Category by Grade for Algebra I

| Diagnostic Gategory | Grade 3 | Grade 4 | Grade 5 | Grade 6 | Grade 7 | Grade 8 | HS |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Module 1 - Operations with Real Numbers and <br> Expressions | 13 | 11 | 5 | 17 | 10 | 7 | 18 |
| Module 1 - Linear Equations \& Inequalities | 0 | 0 | 0 | 3 | 3 | 8 | 16 |
| Module 2 - Functions \& Coordinate Geometry | 0 | 3 | 1 | 4 | 1 | 10 | 21 |
| Module 2 - Data Analysis | 3 | 0 | 1 | 4 | 7 | 4 | 11 |

## GEOMETRY

The Keystone Geometry Assessment Anchors and Eligible Content has two reporting categories: Module 1, Geometric Properties \& Reasoning, and Module 2, Coordinate Geometry \& Measurement. These modules are each divided into two diagnostic categories. Module 1 is divided into Geometric Properties and Congruence, Similarity, \& Proofs. Module 2 is divided into Coordinate Geometry \& Right Triangles and Measurement. The number of Eligible Content from each grade that map to these diagnostic categories is shown in the following table.

Table 2-4. Number of Eligible Content per Diagnostic Category by Grade for Geometry

| Diagnostic Category | Grade 3 | Grade 4 | Grade 5 | Grade 6 | Grade 7 | Grade 8 | HS |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Module 1 - Geometric Properties | 2 | 2 | 1 | 1 | 5 | 1 | 18 |
| Module 1 - Congruence, Similarity, \& Proofs | 0 | 1 | 0 | 0 | 0 | 2 | 3 |
| Module 2 - Coordinate Geometry \& Right <br> Triangles | 0 | 0 | 1 | 3 | 1 | 7 | 5 |
| Module 2 - Measurement | 6 | 4 | 2 | 4 | 3 | 0 | 13 |

## ALGEBRA II

The Keystone Algebra II Assessment Anchors and Eligible Content has two reporting categories: Module 1, Number Systems and Non-Linear Expressions \& Equations, and Module 2, Functions and Data Analysis. These modules are each divided into two diagnostic categories. Module 1 is divided into Operations with Complex Numbers and Non-Linear Expressions \& Equations. Module 2 is divided into Functions and Data Analysis. The number of Eligible Content from each grade that map to these diagnostic categories is shown in the following table.

Table 2-5. Number of Eligible Content per Diagnostic Category by Grade for Algebra II

| Diagnostic Gategory | Grade 3 | Grade 4 | Grade 5 | Grade 6 | Grade 7 | Grade 8 | HS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Module 1 - Operations with Complex Numbers | 0 | 0 | 0 | 0 | 0 | 0 | 4 |
| Module 1 - Non-Linear Expressions \& Equations | 0 | 1 | 1 | 16 | 9 | 8 | 30 |
| Module 2 - Functions | 0 | 3 | 0 | 1 | 0 | 5 | 20 |
| Module 2 - Data Analysis | 3 | 0 | 1 | 4 | 7 | 3 | 11 |

## SCIENCE LOWER GRADES AND SCIENCE

There are four diagnostic categories for the science assessments. These are The Nature of Science, Biological Sciences, Physical Sciences, and Earth/Space Sciences. The number of Eligible Content from each grade that map to these diagnostic categories is shown in the table below.

Table 2-6. Number of Eligible Content per Diagnostic Category by Grade for Science Lower Grades and Science

| Diagnostic Category | K-2 | Grade 3 | Grade 4 | Grade 5 | Grade 6 | Grade 7 | Grade 8 | HS |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| The Nature of Science | 7 | 9 | 20 | 8 | 10 | 19 | 31 | 27 |
| Biological Sciences | 7 | 14 | 18 | 11 | 7 | 21 | 21 | 38 |
| Physical Sciences | 1 | 10 | 9 | 12 | 12 | 12 | 12 | 46 |
| Earth/Space Sciences | 8 | 13 | 16 | 8 | 7 | 11 | 13 | 14 |

## BIOLOGY

The Keystone Biology Exam has two reporting categories: Module 1[A], Cells and Cell Processes, and Module 2[B], Continuity and Unity of Life. These modules are each divided into two diagnostic categories. Module 1 is divided into Basic Biological Principles/Chemical Basis for Life and Bioenergetics/Homeostasis \& Transport. Module 2 is divided into Cell Growth \& Reproduction/Genetics and Theory of Evolution/Ecology. The number of Eligible Content from each grade that map to these diagnostic categories is shown in the following table.

Table 2-7. Number of Eligible Content per Diagnostic Category by Grade for Biology

| Diagnostic Category | Grade 3 | Grade 4 | Grade 5 | Grade 6 | Grade 7 | Grade 8 | HS |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Module 1 - Basic Biological Principles/Chemical <br> Basis for Life | 5 | 5 | 3 | 3 | 5 | 5 | 9 |
| Module 1 - Bioenergetics/Homeostasis \& Transport | 0 | 0 | 0 | 0 | 0 | 0 | 7 |
| Module 2 - Cell Growth \& Reproduction/Genetics | 2 | 1 | 1 | 0 | 5 | 4 | 10 |
| Module 2 - Theory of Evolution/Ecology | 8 | 13 | 5 | 3 | 18 | 18 | 12 |

## CHEMISTRY

The Keystone Chemistry Assessment Anchors and Eligible Content has two reporting categories: Module 1[A], Structure and Properties of Matter, and Module 2[B], The Mole Concept and Chemical Interactions. These modules are each divided into two diagnostic categories. Module 1 is divided into Properties \& Classification of Matter and Atomic Structure \& the Periodic Table. Module 2 is divided into The Mole \& Chemical Bonding and Chemical Relationships \& Reactions. The number of Eligible Content from each grade that map to these diagnostic categories is shown in the following table.

Table 2-8. Number of Eligible Content per Diagnostic Category by Grade for Chemistry

| Diagnostic Gategory | Grade 3 | Grade 4 | Grade 5 | Grade 6 | Grade 7 | Grade 8 | HS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Module 1 - Properties \& Classification of Matter | 7 | 4 | 7 | 7 | 3 | 3 | 10 |
| Module 1 - Atomic Structure \& The Periodic Table | 0 | 0 | 0 | 0 | 1 | 0 | 8 |
| Module 1 - The Mole \& Chemical Bonding | 0 | 0 | 0 | 0 | 1 | 1 | 9 |
| Module 2 - Chemical Relationships \& Reactions | 0 | 0 | 1 | 0 | 1 | 1 | 7 |

## READING LOWER GRADES AND READING/LITERATURE

The Reading Lower Grades and Reading/Literature Assessments use the same diagnostic categories across grades 3 through 8 and the high school Literature course. These diagnostic categories are not divided across the two Keystone Literature Modules (reporting categories) of Fiction and Non-fiction. The diagnostic categories for Reading Lower Grades and Reading/Literature are Key Ideas and Details - Literature Text; Key Ideas and Details - Informational Text; Craft and Structure/Integration of Knowledge and Ideas - Literature Text; Craft and Structure/Integration of Knowledge and Ideas - Informational Text; and Vocabulary Acquisition and Use. The number of Eligible Content from each grade that map to these diagnostic categories is shown in the following table.

Table 2-9. Number of Eligible Content per Diagnostic Category by Grade for Reading Lower Grades and Reading/Literature

| Diagnostic Category | Kindergarten* | Grade 1* | Grade 2* | Grade 3 | Grade 4 | Grade 5 | Grade 6 | Grade 7 | Grade 8 | HS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Key Ideas and DetailsLiterature Text | 3 | 3 | 3 | 3 | 3 | 3 | 3 | 3 | 3 | 8 |
| Key Ideas and DetailsInformational Text | 3 | 3 | 3 | 3 | 3 | 3 | 3 | 3 | 3 | 12 |
| Craft and Structure/ Integration of Knowledge and Ideas-Literature Text | 2 | 2 | 2 | 2 | 2 | 2 | 4 | 4 | 4 | 14 |
| Craft and Structure/ <br> Integration of <br> Knowledge and Ideas- <br> Informational Text | 4 | 4 | 4 | 5 | 5 | 5 | 5 | 5 | 5 | 18 |
| Vocabulary Acquisition and Use | 2 | 2 | 2 | 4 | 4 | 4 | 4 | 4 | 4 | 6 |

[^3]
## WRITING LOWER GRADES AND WRITING/ENGLISH COMPOSITION

The Writing Lower Grades and Writing/English Composition Assessments use the same diagnostic categories across grades 3 through 8 and the high school English Composition course. The diagnostic categories for Writing Lower Grades and Writing/English Composition are Quality of Writing: Focus and Organization, Quality of Writing: Content and Style, Quality of Writing: Editing, Conventions: Punctuation, Capitalization, and Spelling, and Conventions: Grammar and Sentence Formation. The number of Eligible Content from each grade that map to these diagnostic categories is shown in the following table.

Table 2-10. Number of Eligible Content per Diagnostic Category by Grade for Writing Lower Grades and Writing/English Composition

| Diagnostic Category | Kindergarten* | Grade 1* | Grade 2* | Grade 3 |  |  |  | Grade 7 | Grade 8 | HS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Quality of Writing: <br> Focus and Organization | 3 | 6 | 6 | 6 | 6 | 6 | 6 | 6 | 6 | 4 |
| Quality of Writing: Content and Style | 2 | 3 | 3 | 3 | 3 | 5 | 5 | 5 | 5 | 4 |
| Quality of Writing: <br> Editing | 0 | 3 | 3 | 4 | 10 | 12 | 11 | 10 | 6 | 13 |
| Conventions: <br> Punctuation, Capitalization, and Spelling | 1 | 3 | 2 | 6 | 4 | 5 | 3 | 3 | 3 | 5 |
| Conventions: <br> Grammar and Sentence Formation | 2 | 3 | 2 | 10 | 9 | 9 | 9 | 7 | 5 | 2 |

[^4]
## CHAPTER THREE: GENERAL CLASSROOM DIAGNOSTIC TOOLS TEST DEVELOPMENT PROCESSES

The operational item pool for each Classroom Diagnostic Tool (CDT) subject is made up of multiple-choice items that were field tested in a stand-alone field test administration in addition to a smaller number of multiple choice, evidence-based selected-response (Reading only), and technology-enhanced (Science only) items embedded later in operational assessments. Due to the large number of items needed for each CDT Computer Adaptive Test (CAT) to provide reliable information about student strengths and areas of need, it was decided to stagger the content areas for both development and field testing. Appendix A shows a graphic representation of the basic process flow and overlap of the development cycles.

Mathematics (comprising Mathematics, Algebra I, Algebra II, and Geometry) was developed first. After initial development and internal reviews by DRC, the items were taken to be reviewed by Pennsylvania educators. Upon completion of the educator reviews, edits were incorporated and items were placed into fixed-form, online field-test forms for a stand-alone, voluntary field test. For more information regarding the field test, see Chapter Six. After the field test, item statistics were reviewed, and those items that had questionable data were taken to an item data review with Pennsylvania educators. See Chapter Six for more information about this meeting. Following the item data review, all items administered during the field test were reviewed by a committee of Pennsylvania educators for alignment to the Learning Progression Maps. More information about this meeting is found later in this chapter. After the alignment review, committees of Pennsylvania educators participated in a benchmarking activity to determine the points on the scale at which students in each of grades 5 through high school could be considered solidly ready for the next course. For more information about the benchmarking process, see Chapter Ten. Following this set of meetings, the statuses of items were updated, and accepted items were included in the item pool for the operational administrations.

This same process was then repeated for Literature (comprising Reading and Literature) and for Science (comprising Science, Biology, and Chemistry), and then finally for Writing (comprising Writing and English Composition). See Appendix A for more information about the basic development cycles for these three subjects.

Additional items in Mathematics and Reading/Literature were developed for an embedded field test in spring 2013. The purpose of this development was to supplement the pool with additional items aligned to the Pennsylvania Core Standards in preparation for the transition to align all Mathematics and Literacy (Reading/Literature and Writing/English Composition) assessments with the Pennsylvania Core Standards. Following the field test, the items that had questionable data were taken to an item data review with Pennsylvania educators (more information about this meeting can be found in Chapter Six). Following the item data review, all items administered during the field test were reviewed by a committee of Pennsylvania educators for alignment to the Learning Progression Maps using the same procedure that was used for the initial development of each pool of items.

In fall 2013, a voluntary stand-alone field test was conducted for items aligned to the Mathematics and English Language Arts (Reading and Writing) Pennsylvania Core Standards in kindergarten through grade 2, the K-2 Science Assessment Anchors and Eligible Content, and the Mathematics, English Language Arts, and Science Assessment Anchors and Eligible Content for grades 3 and 4. These were administered to students in grades 3 through 5, as described in Chapter Six. At the same time, items developed to align to the Mathematics, English Language Arts, and Science Assessment Anchors and Eligible Content for grade 5 were administered as part of an embedded field test to students in grade 6 that completed an operational CDT administration. The purpose of these two field test administrations was to provide enough items to allow students in grades 3 through 5 to be included in the CDT assessments. The Mathematics Lower Grades, Reading Lower Grades, Science Lower Grades, and Writing Lower Grades assessments became available in spring 2014.

Additional items in were developed in 2015 for an embedded field test in 2016. The purpose of this development was to supplement the pool with additional items including Evidence Based Selected Response (EBSR) items aligned to the Pennsylvania Core Standards for the reading/literature CDT. These EBSR items were developed to align to the English Language Arts Assessment Anchors and Eligible Content for grades 3 through 8 and were administered as part of an embedded field test to students that completed an operational CDT administration. Additional multiple-choice items were also field tested in mathematics and science.

An additional set of items in were developed in 2018 for an embedded field test in 2018. The purpose of this development was to supplement the pool with additional items in mathematics, English language arts and science. These items were aligned to the Mathematics and English Language Arts (Reading and Writing) Pennsylvania Core Standards in kindergarten through grade 2, the K-2 Science Assessment Anchors and Eligible Content, and the Mathematics, English Language Arts, and Science Assessment Anchors and Eligible Content. The additional items made for a more robust pool of items from which the Diagnostic Category assessments and the full CDT could draw.

An additional set of items in were developed in 2018 and 2019 for science. These items were aligned to the K-2 Science Assessment Anchors and Eligible Content. All additional items were technology-enhanced items meant to increase the rigor of the science pool as well as provide alternative ways to assess various science concepts. The additional items made for a more robust pool of science items from which the Diagnostic Category assessments and the full CDT could draw.

## ITEM DEVELOPMENT CONSIDERATIONS

Alignment to the PSSA and Keystone Assessment Anchors and Eligible Content, grade- or course-level appropriateness (as specified by PDE), depth of knowledge (DOK), item/task level of complexity, estimated difficulty level, relevancy of context, rationale for distractors, style, accuracy, and correct terminology were major considerations in the item development process. The Standards for Educational and Psychological Testing (AERA, APA, NCME, 1999) and the Principles of Universal Design (Thompson, Johnstone, \& Thurlow, 2002) guided the development process. In addition, DRC's Bias, Fairness, and Sensitivity Guidelines were used for developing items. All items were reviewed for fairness by bias and sensitivity committees and for content by Pennsylvania educators and field specialists.

## BIAS, FAIRNESS, AND SENSITIVITY OVERVIEW

At every stage of the item and test development process, DRC employs procedures that are designed to ensure that items and tests meet Standard 7.4 of the Standards for Educational and Psychological Testing (AERA, APA, NCME, 1999).

Standard 7.4: Test developers should strive to identify and eliminate language, symbols, words, phrases, and content that are generally regarded as offensive by members of racial, ethnic, gender, or other groups, except when judged to be necessary for adequate representation of the domain.

To meet Standard 7.4, DRC employs a series of internal quality steps. DRC provides specific training for test developers, item writers, and reviewers on how to write, review, revise, and edit items for issues of bias, fairness, and sensitivity (as well as for technical quality). Training also includes an awareness of and sensitivity to issues of cultural diversity. In addition to providing internal training in reviewing items in order to eliminate potential bias, DRC also provides external training to the review panels of minority experts, teachers, and other stakeholders.

DRC's guidelines for bias, fairness, and sensitivity includes instruction concerning how to eliminate language, symbols, words, phrases, and content that might be considered offensive by members of racial, ethnic, gender, or other groups. Areas of bias that are specifically targeted include, but are not limited to, stereotyping, gender, regional/geographic, ethnic/cultural, socioeconomic/class, religious, experiential, and biases against a particular age group (ageism) or persons with disabilities. DRC catalogues topics that should be avoided and maintains balance in gender and ethnic emphasis within the pool of available items and passages.

## UNIVERSAL DESIGN OVERVIEW

The Principles of Universal Design were incorporated throughout the item development process to allow participation of the widest possible range of students in the Classroom Diagnostic Tools. The following checklist was used as a guideline:

- Items measure what they are intended to measure.
- Items respect the diversity of the assessment population.
- Items have a clear format for text.
- Stimuli and items have clear pictures and graphics.
- Items have concise and readable text.
- The arrangement of the items on the test has an overall appearance that is clean and well organized.

A more extensive description of the application of the Principles of Universal Design is found in Chapter Four.

## DEPTH OF KNOWLEDGE (DOK) OVERVIEW

An important element in statewide assessments is the alignment between the overall assessment system and the state's standards. A methodology developed by Norman Webb $(1999,2006)$ offers a comprehensive model that can be applied to a wide variety of contexts. With regard to the alignment between standards statements and the assessment instruments, Webb's criteria include five categories, one of which deals with content. Within the content category is a useful set of levels for evaluating depth of knowledge (DOK). According to Webb (1999), "depth-of-knowledge consistency between standards and assessments indicates alignment if what is elicited from students on the assessment is as demanding cognitively as what students are expected to know and do as stated in the standards" ( $\mathrm{p} .7-8$ ). The four levels of cognitive complexity (i.e., depths of knowledge) are as follows:

- Level 1: Recall
- Level 2: Application of Skill/Concept
- Level 3: Strategic Thinking
- Level 4: Extended Thinking

Depth-of-knowledge levels were incorporated in the item writing and review process, and items were coded with respect to the level each represented.

## PASSAGE READABILITY OVERVIEW

Evaluating the readability of a passage is essentially a judgmental process by individuals familiar with the classroom context and what is linguistically appropriate. Although various readability indices were computed and reviewed, it is recognized that such methods measure different aspects of readability and are often fraught with particular interpretive liabilities. Thus, the commonly available readability formulas were not used in a rigid way, but more informally to provide for several snapshots of a passage that senior test development staff considered along with experience-based judgments in guiding the passage selection process. In addition, passages were reviewed by committees of Pennsylvania educators who evaluated each passage for readability and grade-level appropriateness.

## TEST ITEM READABILITY OVERVIEW

Careful attention was given to the readability of the items to make certain that the assessment focus of the item did not shift based on the difficulty of reading the item. Subject/course areas such as Mathematics, Algebra I, Science, or Biology contain many content-specific vocabulary terms. As a result, readability formulas were not used. However, wherever it was practicable and reasonable, every effort was made to keep the vocabulary at or one level below the grade or course level for non-Reading/Literature items. There was a conscious consideration made to ensure that each question was evaluating a student's ability to build toward mastery of the course standards versus the student's reading ability. Resources used to verify the vocabulary level were the EDL Core Vocabularies and the Children's Writer's Word Book.

In addition, every test question is brought before committees comprised of Pennsylvania educators who are course-level/grade-level experts in the content field in question. They review each question from the perspective of the students they teach, and they determine the validity of the vocabulary used and work to minimize the level of reading required.

## ITEM AND TEST DEVELOPMENT CYCLE

The item development process for items followed a logical cycle and timeline, which is outlined in the figure on the following page. On the front end of the schedule, tasks were generally completed with the goal of presenting field test candidate items to committees of Pennsylvania educators. On the back end of the schedule, all tasks lead to the field test data review and operational test construction. This presentation represents a typical life cycle for a field test event.

DRC Item and Test Development Primary Cycle
Review RFP requirements, Assessment Anchor Content Standards, Eligible Content, and other information describing the scope and criteria of the Classroom Diagnostic Tools

Train item writers and/or passage/scenario developers in the project requirements and specifications

Passage/scenario development and/or item writing

Item review, editing, coding, graphics production, and tracking (sample items shared with PDE for state-directed feedback)

Item and bias/fairness/sensitivity review by PDE, Pennsylvania educators, and experts in issues of bias, fairness, and sensitivity

Modify items based on committee/PDE recommendations

## GENERAL ITEM AND TEST DEVELOPMENT PROCESS

The following describes the processes which lead up to an operational assessment. These processes were used to develop the entire pool of items that appeared within the field test administrations for potential inclusion in the operational item pool.

## ITEM DEVELOPMENT PLANNING MEETING

Prior to the start of any item development work, DRC's test development staff meets with PDE's assessment office to discuss the test development plans, including the test blueprint, the field test plan (including development counts), procedures, timelines, etc.

## ITEM WRITER TRAINING

Item writers were selected and trained for the subject areas of Mathematics, Algebra I, Algebra II, Geometry, Science, Biology, Chemistry, Reading, Literature, Writing, and English Composition. Qualified writers were college graduates with teaching experience and a demonstrated base of knowledge in the content area. Many of these writers were content assessment specialists and curriculum specialists. The writers were trained individually and had previous experience in writing multiple-choice items. Prior to developing items for the Classroom Diagnostic Tools, the cadre of item writers was trained with regard to the following:

- PSSA and Keystone Assessment Anchors and Eligible Content
- Webb's Levels of Cognitive Complexity, Depth of Knowledge
- Bias, Fairness, and Sensitivity Guidelines
- Principles of Universal Design
- Item Quality Technical Style Guidelines
- Reference Information
- Sample Items

## LITERATURE PASSAGE DEVELOPMENT

The task of developing passages was conducted by DRC professionals with classroom experience in reading/English language arts. These professionals also underwent specialized training (provided by DRC) in the characteristics of acceptable passages. Guidelines for passage development included appropriate length, text structure, density, and vocabulary. A judgment was also made about whether the reading level required by a particular passage was at the independent level-that is, where the average student should be able to read 90 percent of words in the text independently. Passage writers were given the task of writing a specified number of passages for each genre. Passages were commissioned by experienced authors.

Passages underwent an internal review by several test development content editors to judge their merit with regard to the following criteria:

- Passages have interest value for students.
- Passages are appropriate in terms of vocabulary and language characteristics.
- Passages are free of bias, fairness, and sensitivity issues.
- Passages represent different cultures.
- Passages are able to stand the test of time.
- Passages are sufficiently rich to generate a variety of multiple-choice items.
- Passages avoid dated subject matter unless a relevant historical context is provided.
- Passages should not require students to have extensive background knowledge in a certain discipline or area to understand a text.

Once through the internal review process, those passages deemed potentially acceptable were reviewed by the Reading Content Committee and Bias, Fairness, and Sensitivity Committee for final approval.

## ITEM AUTHORING AND TRACKING

Initially, items are generated with software-prepared Classroom Diagnostic Tools Item Cards, which allows for preliminary sorting and reviewing. A column against the right margin includes codes to identify the subject area, grade, content categories, passage information (in the case of reading), item type, depth of knowledge (cognitive complexity), estimated difficulty, answer key, and calculator use (for mathematics items).

All items undergoing field testing were entered into the DRC Item Development and Educational Assessment System (IDEAS), which is a comprehensive, secure, online item banking system. It accommodates item writing, item viewing and reviewing, and item tracking and versioning. IDEAS manages the transition of an item from its developmental stage to its approval for use within a test form. The system supports item history records that include item usage within a form, item-level notes, content categories and subcategories, item statistics from both classical and Rasch item analyses, and classifications derived from analyses of differential item functioning (DIF).

## INTERNAL REVIEWS

To ensure that the items produced were sufficient in number and adequately distributed across subcategories and levels of difficulty, item writers were informed of the required quantities of items. As items were written, an item authoring card was completed. It contained information about the item, such as subject, content category, and subcategories. Based on the item writer's classroom teaching experience, knowledge of the content area curriculum, and cognitive demands required by the item, estimates were recorded for level of cognitive complexity and difficulty level. Items were written to provide for a range of difficulties and cognitive complexities.

As part of the item construction process, each item was reviewed by content specialists and editors at DRC. Content specialists and editors evaluated each item to make sure that it measured the intended Eligible Content and Assessment Anchor. They also assessed each item to make certain that it was appropriate for the intended grade and that it provided only one correct answer. In addition, the difficulty level, depth of knowledge, graphics, language demand, and distractors were also evaluated. Other elements considered in this process include, but are not limited to, Universal Design, bias, source of challenge, grammar/punctuation, and Pennsylvania style. Following these reviews, the items were prepared for the content review meetings conducted with Pennsylvania educators.

## ITEM CONTENT REVIEWS

Prior to the 2010, 2011, 2013, 2015, 2018 and 2019 field testing, all newly developed test items were submitted to content committees for review. The content committees consisted of Pennsylvania educators from school districts throughout the Commonwealth of Pennsylvania, some with postsecondary university affiliations. The primary responsibility of the content committee was to evaluate items with regard to quality and content classification, including grade-level or course appropriateness, estimated difficulty, depth of knowledge, and source of challenge. With source of challenge, items are identified where the cognitive demand is focused on an unintended content, concept, or skill (Webb, 2002). In addition, source of challenge may be attributed if the reason that an answer could be given results from a cultural bias, an inappropriate reading level, or a flawed graphic in an item, or if an item requires specialized, non-content-related knowledge to answer. Source of challenge could result in a student who has mastered the intended content or skill answering the item incorrectly or a student who has not mastered the intended content or skill answering the item correctly. Committee members were asked to note any items with a source of challenge and to suggest revisions to remove the source of challenge. They also suggested revisions and made recommendations for reclassification of items. The committee members also reviewed the items for adherence to the Principles of Universal Design, including language demand and issues of bias, fairness, and sensitivity.

The content review meetings were held in January 2010 for Mathematics, Algebra I, Algebra II, and Geometry, in May/June 2010 for Reading/Literature, Science, Biology, and Chemistry, and in January 2011 for Writing/ English Composition. Additional content review meetings were held in November 2012 (for the additional items aligned to the Pennsylvania Core Standards) and in July 2013 (for the items to allow students in grades 3 through 5 to participate in the CDT). Content review meetings were again held in May of 2015 for Writing items and June of 2015 for Science, Reading, and Math (for additional items aligned to the Pennsylvania Core Standards and the Assessment Anchors and Eligible Content to supplement the pool). Another set of content review meetings took place in January of 2018 to supplement the item pool. The most recent content review meetings were held in January of 2019 for Science technology enhanced items. Committee members were approved by PDE, and PDE-approved invitations were sent to them by DRC. PDE also selected internal staff members for attendance. The meeting commenced with a welcome by PDE and DRC. This was followed by an overview of the test development process by DRC. PDE, along with DRC, also provided training on the procedures and forms to be used for item content review.

DRC content assessment specialists facilitated the reviews and were assisted by representatives of PDE. Committee members, grouped by content area, received training by working through and reviewing a group of items for quality and content, as well as for the following categories:

- Assessment Anchor Alignment
- Content Limits
- Grade-Level (Course-Level) Appropriateness
- Difficulty Level
- Depth of Knowledge
- Appropriate Source of Challenge
- Correct Answer
- Quality of Distractors
- Graphics in Regards to Appropriateness
- Appropriate Language Demand
- Freedom from Bias

The members then received a binder containing items to independently review and provided their recommendation for the status of each item: Approved, Accepted with Revision, or Rejected. All comments were reviewed and addressed by DRC content staff, and, when necessary, PDE staff were consulted.

Security was addressed by adhering to a strict set of procedures. All attendees, with the exception of PDE staff, were required to sign a confidentiality agreement. All materials not in use at any time were stored in a locked room. Secure materials that did not need to be retained after the meetings were deposited in secure barrels, the contents of which were shredded.

## BIAS, FAIRNESS, AND SENSITIVITY REVIEWS

Prior to the 2010, 2011, 2013, 2015, 2018 and 2019 field testing, all newly developed test items were also submitted to a Bias, Fairness, and Sensitivity Committee for review. These reviews took place prior to the Item Content Review for each content area. The committee's primary responsibility was to evaluate items with regard to bias, fairness, and sensitivity issues. They also made recommendations for changes or deletion of items in order to remove the potential for issues of bias, fairness, and/or sensitivity. Included in the review were proposed reading passages. An expert, multi-ethnic committee composed of men and women was trained by a DRC test development lead to review items for bias, fairness, and sensitivity issues. Training materials included a manual developed by DRC (DRC, 2003-2013). Members of the committee also had expertise with special-needs students and English Language Learners. All items were read by a cross-section of committee members. Each member noted bias, fairness, and/or sensitivity comments on tracking sheets and on the item, if needed, for clarification. Committee members individually categorized any concerns as related to ageism, disability, ethnicity/culture, gender, region, religion, socioeconomics, or stereotypes. These categories were the framework through which recommendations for modification or rejection of items occurred during the subsequent committee consensus process. The committee discussed each of the issues as a group and came to a consensus as to which issues should represent the view of the committee. All consensus comments were then compiled, and the suggested actions on these items were recorded and submitted to DRC content staff. This review followed the same security procedures as outlined above.

## ITEMS ALIGNED TO LEARNING PROGRESSION MAPS

Following the field test of items, all items were brought before a committee of Pennsylvania educators for review of each item's alignment to the Learning Progression Map. DRC and PDE provided a general overview of the item and test development process for the Classroom Diagnostic Tools and provided information about the Learning Progression Maps and the purpose of the Classroom Diagnostic Tools. Then the committee reviewed the Learning Progression Map, which shows the vertical articulation of the Assessment Anchors and Eligible Content across grades within a given subject area. Once it was determined that the Learning Progression Map containing the Assessment Anchors and Eligible Content was an accurate representation of how the content progressed across grades, teachers worked in grade-span committees to review items for their alignment with the Assessment Anchor and Eligible Content. When reviewing the alignment to the Assessment Anchor and Eligible Content, educators considered whether the test item measured the content that it purported to measure, as well as the appropriateness of the difficulty and cognitive complexity of the item in relation to the Assessment Anchor and Eligible Content to which the item was aligned. Committees came to a consensus regarding the status of each item: Accepted, Accepted with Revised Alignment, or Rejected.

Security was addressed by adhering to a strict set of procedures. All attendees, with the exception of PDE staff, were required to sign a confidentiality agreement. All materials not in use at any time were stored in a locked room. Secure materials that did not need to be retained after the meetings were deposited in secure barrels, the contents of which were shredded.

## CHAPTER FOUR: UNIVERSAL DESIGN PROCEDURES APPLIED TO THE CLASSROOM DIAGNOSTIC TOOLS TEST DEVELOPMENT PROCESS

## UNIVERSAL DESIGN

Universally designed assessments allow participation of the widest possible range of students and contribute to valid inferences about participating students. Principles of Universal Design are based on the premise that each child in school is a part of the population to be tested and that testing results should not be affected by disability, gender, race, or English language ability (Thompson, Johnstone, \& Thurlow, 2002). At every stage of the item and test development process, procedures were employed to ensure that items and subsequent tests were designed and developed using the elements of universally designed assessments developed by the National Center for Educational Outcomes (NCEO).

Federal legislation addresses the need for universally designed assessments. The No Child Left Behind Act (Elementary and Secondary Education Act) requires that each state must "provide for the participation in [statewide] assessments of all students" [Section $1111(\mathrm{~b})(3)(\mathrm{C})(\mathrm{ix})(\mathrm{I})$ ]. Both Title I and IDEA regulations call for universally designed assessments that are accessible and valid for all students, including students with disabilities and English Language Learners. The benefits of universally designed assessments not only apply to these groups of students, but to all individuals with wide-ranging characteristics. Therefore, it is important that the development of all assessments, including voluntary assessments such as the Classroom Diagnostic Tools, be guided by the Principles of Universal Design.

DRC's test development team was trained in the elements of Universal Design as it relates to developing largescale statewide assessments. Team leaders were trained directly by NCEO, and other team members were subsequently trained by team leaders. Committees involved in content review included some members who were familiar with the unique needs of students with disabilities and English Language Learners. Likewise some members of the Bias, Fairness, and Sensitivity Committee were conversant with these issues. What follows are the Universal Design guidelines followed during all stages of the item development process for the Classroom Diagnostic Tools.

## ELEMENTS OF UNIVERSALLY DESIGNED ASSESSMENTS

After a review of research relevant to the assessment development process and the Principles of Universal Design (Center for Universal Design, 1997), NCEO has produced seven elements of Universal Design as they apply to assessments (Thompson, Johnstone \& Thurlow, 2002). These elements served to guide item development for the Classroom Diagnostic Tools.

- Inclusive Assessment Population

The target population includes students attending Commonwealth schools in grades 3 through 12 who will be participating in either the Pennsylvania System of School Assessment or the Keystone exams.

- Precisely Defined Constructs

An important function of well-designed assessments is that they actually measure what they are intended to measure. The Assessment Anchor Content Standards and Eligible Content for both PSSA and the Keystone Exams, as well as the Pennsylvania Academic Standards for Writing, provided clear descriptions of the constructs to be measured by the Classroom Diagnostic Tools assessments. Universally designed assessments must remove all non-construct-oriented cognitive, sensory, emotional, and physical barriers.

- Accessible, Non-biased Items

DRC conducted both internal and external reviews of items and test specifications to ensure that they did not create barriers because of lack of sensitivity to disability, culture, or other subgroups. Items and test specifications were developed by a team of individuals who understand the varied characteristics of items that might create difficulties for any group of students. Accessibility is incorporated as a primary dimension of test specifications, so accessibility was woven into the fabric of the test rather than being added after the fact.

- Amenable to Accommodations

Even though items on universally designed assessments are accessible for most students, there are some students who continue to need accommodations. This essential element of a universally designed assessment requires that the exam is compatible with accommodations and a variety of widely used adaptive equipment and assistive technology.

- Simple, Clear, and Intuitive Instructions and Procedures

Assessment instructions should be easy to understand, regardless of a student's experience, knowledge, language skills, or current concentration level. Questions that are posed using complex language can invalidate the test if students cannot understand how they are expected to respond to a question. To meet this guideline, directions and questions were prepared in simple, clear, and understandable language that underwent multiple reviews.

## - Maximum Readability and Comprehensibility

A variety of guidelines exist to ensure the maximum readability and comprehensibility of a test. These features go beyond what is measured by readability formulas. Readability and comprehensibility are affected by many factors, including student background, sentence difficulty, text organization, and others. All of these features were considered as item text was developed.

Plain language is a concept now being highlighted in research on assessments. Plain language has been defined as language that is straightforward and concise. The following strategies for editing text to produce plain language were used during the editing process of the Classroom Diagnostic Tools items:

- Reduction of excessive length
- Use of common words
- Avoidance of ambiguous words
- Avoidance of irregularly spelled words
- Avoidance of proper names
- Avoidance of inconsistent naming and graphic conventions
- Avoidance of unclear signals about how to direct attention
- Maximum Legibility

Legibility is the physical appearance of text, the way that the shapes of letters and numbers enable people to read text easily. Bias can result when tests contain physical features that interfere with a student's focus on or understanding of the constructs that test items are intended to assess. A style guide was developed and was utilized which included dimensions of style consistent with Universal Design.

## GUIDELINES FOR UNIVERSALLY DESIGNED ITEMS

All test items written and reviewed adhered closely to the following guidelines for Universal Design. Item writers and reviewers used a checklist during the item development process to ensure that each aspect was attended to.

1. Items measure what they are intended to measure. Item writing training included ensuring that writers and reviewers had a clear understanding of Pennsylvania's Core Standards, Pennsylvania's Academic Standards, and the PSSA and Keystone Assessment Anchors and Eligible Content. During all phases of test development, items were presented with content-standard information to ensure that each item reflected the intended Academic Standard (Mathematics, Reading, and Writing items aligned to Kindergarten, grade 1, or grade 2) or Eligible Content (all other grades and content areas). Careful consideration of the content standards was important in determining which skills involved in responding to an item were extraneous and which were relevant to what was being tested. In certain types of items an additional skill is necessary, such as the Algebra I test, which requires the student to read.
2. Items respect the diversity of the assessment population. To develop items that avoid content that might unfairly advantage or disadvantage any student subgroup, item writers, test developers, and reviewers were trained to write and review items to avoid issues of bias, fairness, and sensitivity. Training also included an awareness of, and sensitivity to, issues of cultural and regional diversity.
3. Items have a clear format for text. Decisions about how items are presented to students must allow for maximum readability for all students. Appropriate fonts and point sizes were employed with minimal use of italics, which is far less legible and is read considerably more slowly than standard typeface. Captions, keys, and legends were at least a 12-point size, while footnotes and sentence numbers use a 10-point font. ${ }^{1}$ Legibility was enhanced by sufficient spacing between letters, words, and lines. Blank space around paragraphs and between columns and staggered right margins were used.
4. Stimuli and items have clear pictures and graphics. When pictures and graphics were used, they were designed to provide essential information in a clear and uncluttered manner. Illustrations were placed directly next to the information to which they referred, and labels were used where possible. Sufficient contrast between background and text, with minimal use of shading, increased readability for students with visual impairments. Color was not used to convey important information.
5. Items have concise and readable text. Linguistic demands of stimuli and items can interfere with a student's ability to demonstrate knowledge of the construct being assessed. During item writing and review, the following guidelines were used.

- Simple, clear, commonly used words were used whenever possible.
- Extraneous text was omitted.
- Vocabulary and sentence complexity were appropriate for the grade level being assessed.
- Technical terms and abbreviations were used only if they were related to the content being measured.
- Definitions and examples were clear and understandable.
- Idioms were avoided unless idiomatic speech was being assessed.
- The questions to be answered were clearly identifiable.

6. Items allow changes to format without changing meaning or difficulty. An audio accommodation is available in Mathematics Lower Grades, Mathematics, Algebra I, Geometry, Algebra II, Science Lower Grades, Science, Biology, and Chemistry for any student with Individualized Education Program (IEP) requirements related to receiving audio assistance during testing. Additionally, a Magnifier tool that can be used to enlarge an area of the screen is available to all students. This tool can be used at the same time as other tools, such as the Highlighter or Line Guide.
7. The test has an overall appearance that is clean and organized. Images, pictures, and text that may not be necessary (e.g., sidebars, overlays, callout boxes, shading, visual crowding caused by excess information) and that could be potentially distracting to students were avoided. Also avoided were purely decorative features that did not serve a purpose. Information was organized in a left-right, top-bottom format.

## ITEM DEVELOPMENT

DRC works closely with the Pennsylvania Department of Education to help ensure that the Classroom Diagnostic Tools comply with nationally recognized Principles of Universal Design. In addition to the Principles of Universal Design as described in the Classroom Diagnostic Tools Technical Report, DRC applies to each exam the standards for test accessibility as described in Tests Access: Making Tests Accessible for Students with Visual Impairments - A Guide for Test Publishers, Test Developers, and State Assessment Personnel (Allman, 2004).

To this end, DRC ensures that committee members at item and bias reviews are made aware of the Principles of Universal Design and of issues that may adversely affect students with disabilities with the goal of ensuring that Classroom Diagnostic Tools assessments are bias-free for all students.

[^5]
## ITEM FORMAT

For all Classroom Diagnostic Tools assessments, DRC formats the items to maximize accessibility for all students by using text that is in a size and font style that is easily readable. DRC limits shading, graphics, and charts. DRC ensures that graphics, pictures, diagrams, charts, and tables are positioned on the page with the associated test items. DRC uses high contrast for text and background where possible to convey pertinent information.

DRC ensures consistency across Classroom Diagnostic Tools assessments by following these Principles of Universal Design:

- High contrast and clarity is used to convey detailed information.
- Typically, shading is avoided; when necessary for content purposes, 10-percent screens are used as the standard.
- Overlaid print on diagrams, charts, and graphs is avoided.
- Charts, graphs, diagrams, and tables are clearly labeled with titles and with short descriptions where applicable.
- Only relevant information is included in diagrams, pictures, and graphics.
- Symbols used in keys and legends are meaningful and provide reasonable representations of the topics they depict.

## ASSESSMENT ACCOMMODATIONS

While universally designed assessments provide for participation of the widest range of students, many students require accommodations in order to participate in the regular assessment. Clearly, the intent of providing accommodations for students is to ensure that students are not unfairly disadvantaged during testing and that the accommodations used during instruction, if appropriate, are made available as students take the test. The literature related to assessment accommodations is still evolving and often focuses on state policies regulating accommodations rather than on providing empirical data that supports the reliability and validity of the use of accommodations. On a yearly basis, the Pennsylvania Department of Education examines accommodations policies and current research to ensure that valid, acceptable accommodations are available for students. At this time, an audio accommodation is available in Mathematics Lower Grades, Mathematics, Algebra I, Geometry, Algebra II, Science Lower Grades, Science, Biology, and Chemistry for any student with Individualized Education Program (IEP) requirements related to receiving audio assistance during testing. A separate audio accommodation is available for all CDT assessments for students with visual impairments. Additionally, a color choices accommodation allows students who would benefit from a background other than white to select a background color from five available choices (in addition to the white background). A contrasting color allows students who would benefit from different text and background color combinations to select from seven options (in addition to black text on a white background).

## CHAPTER FIVE: TEST ADMINISTRATION PROCEDURES

## TEST SETUP

The process to set up students to take the Classroom Diagnostic Tools (CDT) is accomplished through an online interface located on the eDIRECT site (https://www.drcedirect.com/all/eca-portal-ui/welcome/PA). The eDIRECT site is a permission-based site that enables districts to assign users different roles and permissions depending on their role in the setup process. Each district can set up users with as much or as little permission as deemed necessary. A user's role and permission may be modified at any time.

The student and teacher information is imported by user upload at any time. Once the data is imported, users organize students into student groups and test sessions. Student groups and test sessions can be created by class, grade, school, or any other variation.

Each student group is assigned to a specific teacher. Students may belong to multiple student groups and multiple teachers can be assigned to the same student group. This allows districts/schools the ability to allow multiple users to view the data by class, grade, or even school. Student groups may be created and modified at any time during the administration window.

Test sessions are generated to create test tickets that will be distributed to students prior to testing. A test ticket contains the student's full name, user name, password, and the assessment he/she will be taking. The test session, like the student group, may also be created by class, grade, and school. Each time an assessment is administered, a new test session must be created. Test sessions can be copied to simplify administering the CDT to the same students multiple times each year.

## SAMPLE TEST SESSION TICKET

## CDT

## ASHLEE ABBOTT <br> Reading/Literature

Username: 3924540101
Password: SWAM8481

The CDT is untimed. Each full CDT should take the typical student 50 to 90 minutes to complete and is between 48 and 60 items in length. Each Diagnostic Category (DC) CDT should take the typical student 20-30 minutes to complete. The writing, science and math Diagnostic Category CDTs are between 15-18 items. The reading Diagnostic Categroy CDTs are between 35-45 items. The CDT may be administered in one sitting, but it is possible to administer the CDT over multiple days and recommended for the Grades 3-5 assessments.

It is recommended that a student take one of the available full CDTs three times in a given school year. It is also recommended that the use of the Diagnostic Category CDT or a mix of the full CDT and DC CDT not exceed the equivalent of completing 3 full CDTs. There should be enough time between CDT administrations to allow for instructional impact to be reflected in the student's results. Though there are no restrictions on the time between CDTs, there is a restriction in the Test Setup system that only allows a student to be associated with a single CDT a maximum of five (5) times within a given school year.

## PA ONLINE ASSESSMENTS SOFTWARE

Prior to testing, each student computer needs to have the PA Online Assessments software installed. The testing software downloads are located on the eDIRECT site. The installer is an MSI file that can be pushed out across a server to expedite the installation process. Once the software is installed, users also have access to the PA Assessment Online Student Tutorials and the PA Assessment Online Tools Training (OTT). Users are encouraged to run the Online Tools Training prior to testing as it does interact with DRC servers exactly like an actual CDT assessment. Completion of the OTT will provide a good indication that the software installed correctly, and everything is configured properly on the network.

The web-based PA Online Assessment Student Tutorials are available for each operational assessment and are designed to be used by students at all grade levels. They use pictures, motion, and sound to present visual and verbal descriptions of the features and functionality of the PA Online Assessment system. It is recommended to allow a minimum of 20 minutes to view the tutorials. Tutorials may be reviewed as often as needed.

The PA Assessment Online Tools Training (OTT) is designed to provide an introductory experience using the online assessment software in preparation for taking the CDT. The purpose of the OTT is for students to observe and experiment with the features of the online assessment software prior to the actual assessment. The OTT is NOT designed to demonstrate complete coverage of the tested content, and it is NOT scored. Rather, sample items have been chosen to demonstrate online assessment features and uses.

In May 2020 DRC released a public version of the INSIGHT browser to allow students to take the CDT from home during the Covid-19 pandemic. Please refer to Appendix J for information about the public browser.

## Welcome to <br> Pennsylvania Online Assessments

Online Tools Training

## DRC INSIGHT Online Assessments Tutorials

## TRAINING AND CUSTOMER SERVICE SUPPORT

Prior to testing, training was provided to District Technology Coordinators and District Assessment Coordinators. All training is administered via web conference and lasts approximately $11 / 2$ hours. Test Coordinator Training goes over tasks that need to be completed prior to testing. A large portion of the training is dedicated to the setup of users and the creation of student groups and test sessions.

Technology Coordinator Training focuses on all technical aspects required for the setup of the CDT. Detailed installation instructions of the PA Online Assessments Software and Central Office Service - Service Device (COS-SD) are provided. The COS-SD runs on a server within the local network and helps mitigate internet traffic by allowing student machines to retrieve items from the COS-SD rather than from DRC servers. The CDT requires an internet connection at all times.

# Student Interface <br> System Requirements 

Windows / Linux Installer System Requirements

- 4 GB of RAM recommended
- Screen resolution of $1024 \times 768$ or higher
- Mouse; Keyboard
- 20 GB of available hard disk space or greater
- Dual-core i5 at 2 GHz or equivalent

Window/Linus Supported Operating Systems

- Windows Vista, SP2
- Windows 7, SP1
- Windows 8 (including 8.1)
- Windows 10 (version 1507, 1511, and Redstone 1)
- Windows Server 2008 (SP2, R2, SP1)
- Windows Server 2012 (R2)
- Ubuntu (12.04 and 12.04) LTS version, with 32- and 64-bit Gnome 3.4, Unity Shell

Macintosh Installer System Requirements

- 4 GB of RAM recommended
- Screen resolution of 1024 X 768 or higher
- Mouse; Keyboard
- 20 GB of available hard disk space or greater
- Dual-core i5 at 2 GHz or equivalent

Supported Operating Systems

- Apple® Mac OS X® 10.7
- Apple® Mac OS X® 10.8
- Apple® Mac OS X® 10.9
- Apple® Mac OS X® 10.10
- Apple® Mac OS X® 10.11

Chrome OS Installer System Requirements

- 4 GB of RAM or more
- Screen resolution $1024 \times 768$ or higher
- 2 GHz or faster processor

Chrome OS Supported Operating Systems

- Chrome OS recent stable channel

Apple iOS Installer System Requirements

- Screen resolution of $1024 \times 768$ or higher

Apple iOS Supported Operating System

- 9.3.x

Android Installer System Requirements

- Screen resolution of $1024 \times 768$ or higher

Android Supported Operating System

- Lollipop 5.x

Users are encouraged to call or email with any questions or error messages that cannot be resolved. If the problem cannot be resolved via a customer service representative, the issue is escalated to DRC developers. Ninety percent of the time, a solution is provided within twenty-four hours. If the issue requires more research, DRC will contact the caller daily to provide an update.

## FIELD TEST OVERVIEW

All items appearing in the 2019-2020 Classroom Diagnostic Tools (CDT) operational item pools were field tested prior to their use on the operational CDT. The purpose of administering field-test items is to obtain statistics for them so they can be reviewed and approved before becoming operational. Based on this statistical review, many of the field-test items were selected for use in the 2019-2020 CDT operational item pools.

There were eight separate CDT field-test events that contributed items to the 2019-2020 operational item poolsfour stand-alone field-test events and four embedded field-test events. Separate field-test events were needed because the operational CDT was rolled out in phases by content area and available grades.

There were three stand-alone field-test events to build the item pools for students in grade 6 and above. Items in mathematics were field tested in spring 2010. Items in reading and science were field tested in fall 2010. Items in writing were field tested in spring 2011. During these three field-test events, CDT items were field tested on stand-alone fixed forms. The forms were administered in computer-based format only. No paper/pencil versions were available. Field test administration mode was limited to computer-based to mirror the operational CDT, which is an adaptive test requiring computer administration. CDT stand-alone field tests were designed to build vertical scales across all grades and courses within a content area. In order to accomplish this, some field-test forms had items from one grade above or below in addition to on-grade level items. For example, some grade 7 mathematics forms contained items from grade 6 in addition to items from grade 7 . Other grade 7 mathematics forms contained items from both grade 7 and grade 8 . See Chapter Nine for more details.

There was one stand-alone field-test event to build the item pools for students in grades 3 through 5. Items in mathematics, reading, science, and writing were field tested in fall 2013. Again, CDT items were field tested on stand-alone fixed forms. The forms were administered in computer-based format only. No paper/pencil versions were available. In order to link to the existing operational scales, some operational grade-level items were included in the field-test forms. See Chapter Twelve for more details.

In addition to the four stand-alone field-test events that contributed items to the 2019-2020 operational item pools, there were four field-test events in which a small number of field-test items were included (embedded) within the operational CDT. In spring 2013, field-test items were included in mathematics and reading. The purpose of this embedded field test was to add items to the operational item pools that align to the Pennsylvania Core Standards. In fall 2013, field-test items were included in mathematics, reading, science, and writing. The purpose of this embedded field test was to field test additional items in grade 5 that could be used in the item pools for students in grades 3 through 5. In 2015-2016, seven of the thirteen CDTs included a small number of embedded field-test items. The purpose of this embedded field test was to supplement the existing item pools and to introduce the evidence-based selected-response (EBSR) item type in the reading content area. In 2018-2019, all CDTs included a small number of embedded field-test items. The purpose of this embedded field test was to supplement the existing item pools in all content areas and grades/courses.

In 2019-2020, all CDTs in the science content area except Chemistry included a small number of embedded fieldtest items in addition to the operational items used to generate a student's score. The purpose of the embedded field test was to supplement the existing item pools and to introduce the technology-enhanced (TE) item type. As in previous embedded field tests, field-test items were included within the operational administration and students did not know which items were field-test items (items that do not count toward a student's score). Therefore, the embedded field-test items can be linked to the existing operational scales. See Chapter Twelve for details.

## CDT STAND-ALONE FIELD TESTS

## SPRING 2010-MATHEMATICS

The stand-alone field test administered in spring 2010 was designed to yield enough items to populate the item pool for CDT Mathematics. Items covering the Eligible Content in grades 3 through 8 and courses Algebra I, Geometry, and Algebra II were field tested. Items covering grade 11 Eligible Content that were NOT covered in Algebra I, Geometry, or Algebra II were also field tested.

Participation in the field test was voluntary. All schools that wanted to participate were allowed to field test. All students in volunteer schools were encouraged, but not required, to participate.

In order to encourage participation, field-test forms were limited in length. Forms for grades 3, 4, and 5 had 25 items. Forms for grades 6, 7, and 8 and Algebra I, Geometry, and Algebra II courses had 35 items. There were not separate grade 11 forms. Instead, grade 11 items were included on grade 8, Algebra I, Geometry, and Algebra II forms.

Since testing occurred in spring, students had nearly a full year of instruction. Therefore, grade-level forms were assigned to students in the corresponding grade (e.g., students in grade 7 took grade 7 forms). Course-level forms were assigned to students currently taking the course (e.g., students in a Geometry course took Geometry forms).

Each student was randomly assigned one of the appropriate grade- or course-level forms at the time of testing.
Table 6-1. Spring 2010 Mathematics Field-Test Form Details

| Grade/Gourse | Number of <br> Items | Number of <br> Forms | Number <br> of Vertical <br> Linking <br> Forms |
| :--- | ---: | ---: | ---: |
| Grade 3 | 86 | 8 | 4 |
| Grade 4 | 86 | 10 | 8 |
| Grade 5 | 85 | 10 | 8 |
| Grade 6 | 259 | 16 | 8 |
| Grade 7 | 258 | 16 | 8 |
| Grade 8 | 257 | 18 | 12 |
| Grade 11* | 149 | 0 | 0 |
| Algebra I | 256 | 18 | 8 |
| Geometry | 257 | 16 | 4 |
| Algebra II | 256 | 16 | 4 |

* Grade 11 items were tested on grade 8, Algebra I, Geometry, and Algebra II forms.

## FALL 2010—READING AND SCIENCE

The stand-alone field tests administered in fall 2010 were designed to yield enough items to populate the item pools for CDT Reading/Literature and CDT Science. Reading items covering the Eligible Content in grades 3 through 8 and Literature were field tested. Science items covering the Eligible Content in grades 3 through 8 and Biology and Chemistry courses were field tested. Items covering grade 11 science Eligible Content that were NOT covered in Biology or Chemistry were also field tested.

Participation in the field test was voluntary. All schools that wanted to participate were allowed to field test. All students in volunteer schools were encouraged, but not required, to participate. Schools were allowed to field test in both content areas.

In order to encourage participation, field-test forms were limited in length. Forms for grades 3, 4, and 5 had 25 items. Forms for grades 6, 7, and 8 and Literature, Biology, and Chemistry courses had 35 items. There were not separate grade 11 science forms. Instead, grade 11 science items were included on grade 8 science forms.

Since testing occurred in fall, students did NOT have a full year of instruction at their current grade level. Gradelevel forms were therefore assigned one grade lower (e.g., students in grade 7 took grade 6 forms). Course-level forms were assigned to students who had completed the course during the prior school year.

Each student was randomly assigned one of the appropriate grade- or course-level forms at the time of testing.
Table 6-2. Fall 2010 Reading/Literature Field-Test Form Details

| Grade/Gourse | Number of <br> Items | Number of <br> Forms | Number <br> of Vertical <br> Linking <br> Forms |
| :--- | ---: | ---: | ---: |
| Grade 3 | 86 | 7 | 2 |
| Grade 4 | 87 | 8 | 4 |
| Grade 5 | 86 | 8 | 4 |
| Grade 6 | 210 | 10 | 4 |
| Grade 7 | 192 | 9 | 4 |
| Grade 8 | 192 | 9 | 4 |
| Literature | 348 | 15 | 2 |

Table 6-3. Fall 2010 Science Field-Test Form Details

| Grade/Course | Number of Items | Number of Forms | Number of Vertical <br> Linking Forms |
| :---: | :---: | :---: | :---: |
| Grade 3 | 91 | 7 | 2 |
| Grade 4 | 123 | 11 | 4 |
| Grade 5 | 102 | 9 | 4 |
| Grade 6 | 178 | 9 | 4 |
| Grade 7 | 327 | 15 | 4 |
| Grade 8 | 377 | 22 | 6 |
| Grade 11* | 115 | 0 | 0 |
| Biology | 390 | 16 | 2 |
| Chemistry | 335 | 14 | 2 |

* Grade 11 items were tested on grade 8 forms.

## SPRING 2011-WRITING

The stand-alone field test administered in spring 2011 was designed to yield enough items to populate the item pool for CDT Writing/English Composition. Items covering the Pennsylvania Academic Standards for Writing in grades 3 through 8 and the Eligible Content for English Composition were field tested.

Participation in the field test was voluntary. All schools that wanted to participate were allowed to field test. All students in volunteer schools were encouraged, but not required, to participate.

In order to encourage participation, field-test forms were limited in length. Forms for grades 3, 4, and 5 had 25 items. Forms for grades 6, 7, and 8 and English Composition had 35 items.

Since testing occurred in spring, students had nearly a full year of instruction. Therefore, grade-level forms were assigned to students in the corresponding grade (e.g., students in grade 7 took grade 7 forms).

Each student was randomly assigned one of the appropriate grade- or course-level forms at the time of testing.
Table 6-4. Spring 2011 Writing/English Composition Field-Test Form Details

| Grade/Course | Number of <br> Items | Number of <br> Forms | Number <br> of Vertical <br> Linking <br> Forms |
| :--- | ---: | ---: | ---: |
| Grade 3 | 140 | 10 | 2 |
| Grade 4 | 149 | 12 | 4 |
| Grade 5 | 165 | 13 | 4 |
| Grade 6 | 193 | 9 | 4 |
| Grade 7 | 176 | 9 | 4 |
| Grade 8 | 195 | 9 | 4 |
| English Composition | 365 | 15 | 2 |

## FALL 2013-MATHEMATICS, READING, SCIENCE, AND WRITING

The stand-alone field tests administered in fall 2013 were designed to yield enough items to populate the item pools for each CDT for students in grades 3 through 5 in mathematics, reading, science, and writing. Items covering the Eligible Content in kindergarten through grade 4 were field tested ${ }^{1}$. In order to link to the existing operational scales, some operational grade-level items were included in the field-test forms.

Participation in the field test was voluntary. All schools that wanted to participate were allowed to field test. All students in volunteer schools were encouraged, but not required, to participate. Schools were allowed to field test in all content areas. In order to encourage participation, field-test forms were limited in length. All field-test forms had 25 items.

Since testing occurred in fall, students did NOT have a full year of instruction at their current grade level. Grade-level forms were therefore assigned one grade lower (e.g., students in grade 4 took forms containing grade 3 items). Each student was randomly assigned one of the appropriate grade-level forms at the time of testing.

[^6]Table 6-5. Fall 2013 Mathematics Field-Test Form Details

| Student <br> Grade | Item Grade(s) | Item Type | Number of <br> Items | Number of <br> Forms |
| :--- | :--- | :--- | ---: | ---: |
| Grade 3 | K, 1, 2 | Field Test | $60,90,130$ | 14 |
| Grade 3 | 3 | Link to Op Scale | 15 | 14 |
| Grade 4 | 3 | Field Test | 235 | 12 |
| Grade 4 | 3 | Link to Op Scale | 15 | 12 |
| Grade 5 | 4 | Field Test | 248 | 13 |
| Grade 5 | 4 | Link to Op Scale | 15 | 13 |

Table 6-8. Fall 2013 Writing Field-Test Form Details

| Student <br> Grade | Item <br> Grade(s) | Item Type | Number of <br> Items | Number of <br> Forms |
| :--- | :--- | :--- | ---: | ---: |
| Grade 3 | K, 1, 2 | Field Test | $44,118,117$ | 14 |
| Grade 3 | 3 | Link to Op Scale | 15 | 14 |
| Grade 4 | 3 | Field Test | 60 | 3 |
| Grade 4 | 3 | Link to Op Scale | 15 | 3 |
| Grade 5 | 4 | Field Test | 60 | 3 |
| Grade 5 | 4 | Link to Op Scale | 15 | 3 |

## CDT EMBEDDED FIELD TESTS

## SPRING 2013-MATHEMATICS AND READING

The embedded field test administered in spring 2013 was designed to augment the existing mathematics and reading/literature item pools. Items were aligned to the Pennsylvania Core Standards. Starting on February 14, 2013, all students testing CDT Mathematics took 5 field-test items. All students testing CDT Reading/Literature took 5-7 field-test items, depending on passage length. Students did not know which items were operational and which were field test. Field-test items did not count in calculation of total or diagnostic category scores. Since testing occurred in spring, students had received nearly a full year of instruction. Therefore, grade-level items were assigned to students in the corresponding grade wherever possible.

Table 6-9. Spring 2013 Embedded Field Test Details

| Content Area | Grade/Course | Number of <br> Items |
| :--- | :--- | ---: |
| Mathematics | Grade 4* $^{\star}$ | 56 |
| Mathematics | Grade 5* $^{\star}$ | 67 |
| Mathematics | Grade 6 | 41 |
| Mathematics | Grade 7 | 156 |
| Mathematics | Grade 8 | 73 |
| Mathematics | Grade 3* | 157 |
| Reading | Grade 4* | 58 |
| Reading | Grade 5* | 71 |
| Reading | Grade 6 | 60 |
| Reading | Grade 7 | 56 |
| Reading | Grade 8 | 58 |
| Reading |  | 57 |

*Items in grades 3 through 5 were initially field tested with students in grade 6 because CDT is available to students in grade 6 and above. However, this plan was revised after a few weeks of testing in favor of stand-alone field tests in fall 2013 with students in grades 3 through 5.

## FALL 2013-MATHEMATICS, READING, SCIENCE, AND WRITING

The embedded field test administered in fall 2013 was designed to field test the grade 5 items needed to populate the item pools for each CDT for students in grades 3 through 5 in mathematics, reading, science, and writing. Starting on August 26, 2013, students in grade 6 testing CDT Mathematics, CDT Science, or CDT Writing/English Composition took 5 field-test items. Students in grade 6 testing CDT Reading/Literature took 5-7 field-test items, depending on passage length. Students did not know which items were operational and which were field test. Field-test items did not count in calculation of total or diagnostic category scores. Since testing occurred in fall, students had not received a full year of instruction. Therefore, grade 5 items were assigned to grade 6 students.

Table 6-10. Fall 2013 Embedded Field Test Details

| CDT | Grade | Number of <br> Items |
| :--- | :--- | ---: |
| Mathematics | Grade 5 | 221 |
| Reading/Literature | Grade 5 | 134 |
| Science | Grade 5 | 152 |
| Writing/English Composition | Grade 5 | 71 |

## FALL 2015-MATHEMATICS, READING, SCIENCE, AND WRITING

The embedded field test administered in fall 2015 was designed to field test new items to supplement the item pools in grades 6 and above in mathematics, reading, science, and writing as well as courses Algebra I and Biology. Additionally, the evidence-based selected-response item type was field tested in grades 3 through 8 reading.

Table 6-11. Fall 2015 Embedded Field Test Item Pools

| Content Area | Item Grade/Gourse | Number of <br> MC Items | Number of <br> EBSR Items | Total Number <br> of Items |
| :--- | :--- | ---: | ---: | ---: |
| Mathematics | 6 | 122 | 0 | 122 |
| Mathematics | 7 | 177 | 0 | 177 |
| Mathematics | 8 | 151 | 0 | 151 |
| Mathematics | Algebra I | 150 | 0 | 150 |
| Reading | 3 | 0 | 22 | 22 |
| Reading | 4 | 0 | 22 | 22 |
| Reading | 5 | 0 | 22 | 22 |
| Reading | 6 | 105 | 21 | 126 |
| Reading | 7 | 105 | 21 | 126 |
| Reading | 8 | 105 | 21 | 126 |
| Reading | Literature | 126 | 0 | 126 |
| Science | 6 | 72 | 0 | 72 |
| Science | 7 | 159 | 0 | 159 |
| Science | 8 | 238 | 0 | 238 |
| Science | Biology | 136 | 0 | 136 |
| Writing | 6 | 93 | 0 | 93 |
| Writing | 7 | 93 | 0 | 93 |
| Writing | 8 | 110 | 0 | 110 |
| Writing | English Composition | 104 | 0 | 104 |

Starting on August 24, 2015, seven of the thirteen CDTs included embedded field-test items:

- Students using CDT Math Grades 6-HS, CDT Science Grades 6-HS, and CDT Writing/Eng Comp Grades 6-HS took 5 field-test items. Since testing occurred throughout the year, items were given to students whose grade matched the item's grade and to students one grade above the item's grade (e.g., grade 7 items were given to students in grades 7 and 8).
- Students using CDT Reading/Lit Grades 6-HS took one field-test passage and six associated items. Since testing occurred throughout the year, items were given to students whose grade matched the item's grade and to students one grade above the item's grade (e.g., grade 7 items were given to students in grades 7 and 8).
- Students using CDT Algebra I and CDT Biology took 5 field-test items from the relevant course.
- The only field-test items in grades 3 through 5 reading were EBSR items associated with existing operational passages. Students using CDT Reading Grades 3-5 were eligible to receive field-test EBSR items. However, operational passages that were not a good fit based on a student's performance were not administered just for the sake of field-test items. Instead, a field-test EBSR was administered only if the operational passage was selected for the student. The number of field-test EBSRs was limited to 3 per test.

In all cases, students did not know which items were operational and which were field test. Field test items did not count in calculation of total or diagnostic category scores.

Table 6-12. Fall 2015 Embedded Field Test Design

| Content Area | CDT | Item Grade/Course | Number of Items Embedded | Student Test Grade(s) |
| :---: | :---: | :---: | :---: | :---: |
| Mathematics | Math Grades 6-HS | 6 | 5 MC | 6,7 |
| Mathematics | Math Grades 6-HS | 7 | 5 MC | 7, 8 |
| Mathematics | Math Grades 6-HS | 8 | 5 MC | 8, 9+ |
| Mathematics | Algebra I | Algebra I | 5 MC | Algebra 1 |
| Reading | Reading Grades 3-5 | 3 | 0-3 EBSR | 3,4,5 |
| Reading | Reading Grades 3-5 | 4 | 0-3 EBSR | 3,4,5 |
| Reading | Reading Grades 3-5 | 5 | 0-3 EBSR | 3,4,5 |
| Reading | Reading/Lit Grades 6-HS | 6 | 1 passage* | 6,7 |
| Reading | Reading/Lit Grades 6-HS | 7 | 1 passage* | 7, 8 |
| Reading | Reading/Lit Grades 6-HS | 8 | 1 passage* | 8, 9+ |
| Reading | Reading/Lit Grades 6-HS | Literature | 1 passage* | 9+ |
| Science | Science Grades 6-HS | 6 | 5 MC | 6,7 |
| Science | Science Grades 6-HS | 7 | 5 MC | 7, 8 |
| Science | Science Grades 6-HS | 8 | 5 MC | 8, 9+ |
| Science | Biology | Biology | 5 MC | Biology |
| Writing | Writing/Eng Comp Gr 6-HS | 6 | 5 MC | 6,7 |
| Writing | Writing/Eng Comp Gr 6-HS | 7 | 5 MC | 7, 8 |
| Writing | Writing/Eng Comp Gr 6-HS | 8 | 5 MC | 8, 9+ |
| Writing | Writing/Eng Comp Gr 6-HS | English Composition | 5 MC | 9+ |

* FT reading passages include six multiple-choice items OR five multiple-choice items and one evidence-based selected-response item.

## FALL 2018-MATHEMATICS, READING, SCIENCE, AND WRITING

The embedded field test administered in fall 2018 was designed to field test new items to supplement the item pools in all content areas and grades/courses.

Table 6-13. Fall 2018 Embedded Field Test Item Pools

| Content Area | Item Grade/Course | Number of MC Items | Number of EBSR Items | Total Number of Items |
| :---: | :---: | :---: | :---: | :---: |
| Mathematics | Kindergarten | 20 | 0 | 20 |

| Writing | 8 | 93 | 0 | 93 |
| Writing | English Composition | 294 | 0 | 294 |

Starting on August 20, 2018, all CDTs included embedded field-test items:

- Students using grade level tests in content areas math, science, and writing took 5 field-test items. Since testing occurred throughout the year, items were given to students whose grade matched the item's grade and to students one grade above the item's grade (e.g., grade 7 items were given to students in grades 7 and 8).
- Students using CDTs in the reading content area took one field-test passage with four to six associated items. Since testing occurred throughout the year, items were given to students whose grade matched the item's grade and to students one grade above the item's grade (e.g., grade 7 items were given to students in grades 7 and 8).
- Students using CDT Algebra I, CDT Geometry, CDT Algebra II, CDT Biology, and CDT Chemistry took 5 field-test items from the relevant course.

In all cases, students did not know which items were operational and which were field test. Field test items did not count in calculation of total or diagnostic category scores.

Table 6-14. Fall 2018 Embedded Field Test Design

* FT reading passages include four to six items total with up to one evidence-based selected-response item.

## FALL 2019-SCIENCE

The embedded field test administered in fall 2019 was designed to field test new technology-enhanced items in the science content area.

Table 6-15. Fall 2019 Embedded Field Test Item Pools

| Content Area | Item Grade/Course | Number of <br> Mc Items | Number of <br> TE Items | Total Number <br> of Items |
| :--- | :--- | ---: | ---: | ---: |
| Science | K-2 grade span | 0 | 0 | 0 |
| Science | 3 | 0 | 19 | 19 |
| Science | 4 | 0 | 22 | 22 |
| Science | 5 | 0 | 20 | 20 |
| Science | 6 | 0 | 18 | 18 |
| Science | 7 | 0 | 19 | 19 |
| Science | 8 | 0 | 20 | 20 |
| Science | Biology | 0 | 40 | 40 |
| Science | Chemistry | 0 | 0 | 0 |

Starting on August 19, 2019, CDTs in the science content area except Chemistry included embedded field-test items:

- Students using grade level tests took 2 field-test items. Since testing occurred throughout the year, items were given to students whose grade matched the item's grade and to students one grade above the item's grade (e.g., grade 7 items were given to students in grades 7 and 8).
- Students using CDT Biology took 2 field-test items from the Biology course.

In all cases, students did not know which items were operational and which were field test. Field test items did not count in calculation of total or diagnostic category scores.

## STATISTICAL ANALYSIS OF ITEM DATA

All field-tested items were analyzed statistically following conventional item analysis methods. For MC items, traditional or classical item statistics included the point-biserial correlation (Pt. Bis.) for the correct and incorrect responses (distractors), percent correct (p-value), and the percent selecting each incorrect response. For EBSR and TE items, the statistical indices included the item-test correlation, the point-biserial correlation for each score category, and the percent in each score category.

In general, more capable students are expected to respond correctly to easy items and less capable students are expected to respond incorrectly to difficult items. If either of these situations does not occur, the item will be reviewed by DRC test development staff and committees of Pennsylvania educators to determine the nature of the potential problem and the characteristics of the students affected. The primary way of detecting such conditions is through the point-biserial correlation coefficient for MC items and the item-test correlation for EBSR and TE items. In each case the statistic will be positive if the total-test mean score is higher for the students who respond correctly to MC items or attain a higher EBSR or TE score and negative when the reverse is true.

Item statistics are used as a means of detecting items that deserve closer scrutiny rather than as a mechanism for automatic retention or rejection. Toward this end, a set of criteria was used as a screening tool to identify items needing a closer review by committees of Pennsylvania educators

For an MC item to be flagged, the criteria included any of the following:

- Point-biserial correlation for the correct response of less than 0.10
- Point-biserial correlation for any incorrect response greater than the point-biserial correlation for the correct response
- Differential item functioning (DIF) code of either C - or $\mathrm{C}+{ }^{2}$

[^7]For an EBSR item to be flagged, the criteria included any of the following:

- Part One point-biserial correlation for the correct response of less than 0.10
- Part One point-biserial correlation for any incorrect response greater than the point-biserial correlation for the correct response
- Score proportion less than 0.05
- Differential item functioning (DIF) code of either C- or C+

For a TE item to be flagged, the criteria included any of the following:

- Item-test correlation less than 0.20
- Score proportion less than 0.05
- Differential item function (DIF) code of either C- or C+

These criteria differ slightly from the criteria used for end-of-year/course summative tests such as the Pennsylvania System of School Assessment (PSSA) or the Keystone Exams. For example, CDT items are not flagged for low and high $p$-values. While very easy and very difficult items may not be appropriate for summative tests, they are needed in diagnostic item pools so the computer adaptive item selection routine can find appropriate items for students at various levels.

Item analysis results for 2019-2020 field-test items are presented in Appendix B.

## REVIEW OF ITEMS WITH DATA

In the preceding section on Statistical Analysis of Item Data, it was stated that content-area test development specialists used certain statistics from item and DIF analyses of the field tests to identify items for further review. Specific flagging criteria for this purpose were specified in the previous section. Items not identified for this review were those that had good statistical characteristics and, consequently, were regarded as statistically acceptable, or had extremely poor statistical quality and, consequently were regarded as unacceptable, were removed from the CDT item pools, and needed no further review. However, there were some items that DRC content-area test development specialists and DRC psychometric specialists regarded as needing further review by committees of Pennsylvania educators.

There were separate meetings to review items with data for each field-test event and content area. CDT mathematics items from the spring 2010 stand-alone field test were reviewed by fourteen Pennsylvania educators on August 9, 2010. CDT reading and science items from the fall 2010 stand-alone field test were reviewed by sixteen and fourteen Pennsylvania educators respectively on January 24, 2011. CDT writing items from the spring 2011 stand-alone field test were reviewed by fourteen Pennsylvania educators on August 1, 2011. CDT mathematics and reading items from the spring 2013 embedded field test were reviewed by twenty-two educators respectively on July 16-18, 2013. CDT mathematics, reading, science, and writing items from both the stand-alone and embedded field tests of fall 2013 were reviewed by seven, seven, seven, and eight Pennsylvania educators respectively on January 21-23, 2014. CDT mathematics, reading, science, and writing items from the embedded field tests of fall 2015 were reviewed by 10 Pennsylvania educators for each content group on June 9-10, 2016. CDT mathematics, reading, science, and writing items from the embedded field tests of fall 2018 were reviewed by 10 Pennsylvania educators for each content group on March 26-29, 2019. CDT science technology enhanced items from the embedded field tests 2019 were reviewed by 9 Pennsylvania educators on May 20-21, 2020.

At each of the item data review meetings committee members were first trained with regard to the statistical indices used in item evaluation. This was followed by a discussion with examples concerning reasons that an item might be retained regardless of the statistics. The committee review process involved a brief exploration of possible reasons for the statistical profile of an item (e.g., possible sensitivity/bias, grade appropriateness, instructional issues) and a decision regarding acceptance. DRC content-area test development specialists facilitated the review of the items. Each committee reviewed the pool of field-test items and made recommendations (i.e., accept or reject) for each item.

## DIFFERENTIAL ITEM FUNCTIONING

Differential item functioning occurs when examinees with the same ability level but different group memberships do not have the same probability of answering an item correctly. This pattern of results may suggest the presence of item bias. As a statistical concept, however, DIF can be differentiated from item sensitivity/bias, which is a content issue that can arise when an item presents negative group stereotypes, uses language that is more familiar to one subpopulation than to another, or is presented in a format that disadvantages certain learning styles. While the source of item sensitivity/bias is often easily recognized by trained judges, DIF may have no clear cause. However, studying how DIF arises and how it presents itself can help to detect and correct for it.

## LIMITATIONS OF STATISTICAL DETECTION

No statistical procedure should be used as a substitute for rigorous, hands-on reviews by content and bias specialists. The statistical results can help organize the review so the effort is concentrated on the most problematic cases. Further, no items should be automatically rejected simply because a statistical method flagged them or accepted because they were not flagged.

Statistical detection of DIF is an inexact science. There have been a variety of methods proposed for detecting DIF, but no one statistic can be considered either necessary or sufficient. Different methods are more or less successful depending on the situation. No analysis can guarantee that a test is free of bias, but almost any thoughtful analysis will uncover the most flagrant problems.

A fundamental shortcoming of all statistical methods used in DIF evaluation is that all are intrinsic to the test being evaluated. If a test is unbiased overall but contains one or two DIF items, any method will locate the problems. If, however, all items on the test show consistent DIF to the disadvantage of a given subpopulation, a statistical analysis of the items will not be able to separate DIF effects from true differences in achievement.

## MANTEL-HAENSZEL PROCEDURE OF DIFFERENTIAL ITEM FUNCTIONING

For MC items, the Mantel-Haenszel (MH) procedure (Mantel \& Haenszel, 1959) for detecting differential item functioning is a commonly used technique in educational testing. It does not depend on the application or the fit of any specific measurement model. However, it does have significant philosophical overlap with the Rasch model since it uses a test's total score to organize the analysis.

The procedure as implemented by DRC contrasts a focal group with a reference group. While it makes no practical difference in the analysis which group is defined as the focal group, the group most apt to be disadvantaged by a biased measurement is typically defined as the focal group. In these analyses, the focal group was female for gender-based DIF and black or Hispanic ${ }^{3}$ for ethnicity-based DIF; reference groups were male and white respectively. The MH statistic for each item is computed from a contingency table. It has two groups (focal and reference) and two outcomes (right or wrong). The ability groups are defined by the test's score distribution for the total examinee population.

The basic MH statistic is a single degree of freedom chi-square that compares the observed number in each cell to the expected number. The expected counts are computed to ensure that the analysis is not confounded with differences in the achievement level of the two groups.

For EBSR and TE items, a comparable statistic is computed based on the standardized mean difference (SMD) (Dorans, Schmitt, \& Bleistein, 1992), which is computed as the differences in mean scores for the focal and reference groups if both groups had the same score distribution.

To assist the review committees in interpreting the analyses, the items are assigned a severity code based on the magnitude of the DIF statistic. Items classified as A+ or A- have little or no statistical indication of DIF. Items classified as B+ or B- have some indication of DIF but may be judged to be acceptable for future use. Items classified as C+ or C- have strong evidence of DIF and should be reviewed and possibly rejected from the eligible item pool. The plus sign indicates that the item favors the focal group and a minus sign indicates that the item favors the reference group.

[^9]
## RESULTS AND OBSERVATIONS

Counts of the number of items field tested from each content area and grade/course that were assigned to each severity code are shown in Table 6-18. Some field-test items are classified as N/A (not applicable) because the number of students in either the reference or focal groups who took the item was insufficient for analysis. Where there are sufficient data to run DIF analyses, relatively few items had B or C DIF for the Male/Female, White/Black, or White/Hispanic reference and focal groups.

Table 6-18a. DIF Summary for Mathematics in August 2010

Table 6-18i. DIF Summary for Science in January 2014

| Grade/ Course | Number of Field-test items | Male/ Female A+ | Male/ Female A- | Male/ Female B+ | Male/ Female B- | Male/ Female C+ | Male Female C- | Male/ Female N/A* | White/Black A+ | White/Black A- | White/Black B+ | White/Black B- | White/Black C+ | White/Black C- | White/Black N/A* |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| K-2 | 280 | 130 | 108 | 8 | 13 | 1 | 0 | 20 | 0 | 0 | 0 | 0 | 0 | 0 | 280 |
| 3 | 155 | 69 | 70 | 9 | 4 | 2 | 1 | 0 | 3 | 2 | 0 | 0 | 0 | 0 | 150 |
| 4 | 213 | 94 | 93 | 12 | 12 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 213 |
| 5 | 152 | 58 | 61 | 6 | 8 | 0 | 0 | 19 | 1 | 0 | 0 | 0 | 0 | 0 | 151 |

N/A* Items with insufficient counts for DIF analysis
The plus sign indicates that the item favors the focal group (female or black) and a minus sign indicates that the item favors the reference group (male or white).
Table 6-18j. DIF Summary for Writing in January 2014

| Grade/ Course | Number of <br> Field-test items | $\begin{array}{r} \text { Male/ } \\ \text { Female } \\ \mathrm{A}+ \end{array}$ | Male Female A- | $\begin{array}{r} \text { Male/ } \\ \text { Female } \\ \mathrm{B}+ \end{array}$ | Male/ Female B- | Male/ Female C+ | Male Female C | Malel Female N/A* | White/Black A+ | White/Black A- | White/Black B+ | White/Black B- | White/Black C+ | White/Black C- | White/Black N/A* |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| K | 44 | 20 | 22 | 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 44 |
| 1 | 118 | 71 | 42 | 2 | 3 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 118 |

## CHAPTER SEVEN: CLASSICAL ITEM STATISTICS

This chapter provides an overview of the two most familiar item-level statistics obtained from classical (traditional) item analysis: item difficulty and item discrimination. The following results pertain to all items field tested in the stand-alone and embedded field-test events. Other statistics such as Rasch item statistics are discussed in Chapter Eight.

## ITEM-LEVEL STATISTICS

Appendix B provides classical item statistics for all items field tested in 2019-2020. Classical item statistics for all items field tested prior to 2018-2019 can be found in Appendix B of the 2017-2018 technical report. Classical item statistics for items field tested in 2018-19 can be found in Appendix B of the 2018-2019 technical report. In all versions of appendix B, results are organized by content area, field-test event, and item type (multiple-choice, evidence-based selected-response, and technology-enhanced). These statistics represent the item characteristics most often used to determine whether an item functioned properly and/or how a group of students performed on a particular item. The item statistics in Appendix B include:

- Number of students taking the item (denoted as $N$ )
- Indicators of item difficulty (denoted as PVal)
- $\quad p$-values for multiple-choice (MC) items
- item mean divided by maximum possible item score for evidence-based selected-response (EBSR) and technology-enhanced (TE) items
- Proportions by response option or score point
- proportions of students who chose each response option for MC items (denoted as $\mathrm{P}(\mathrm{A}), \mathrm{P}(\mathrm{B}), \mathrm{P}(\mathrm{C})$, P(D))
- proportions of students who gained each score point for EBSR and TE items (denoted as $\mathrm{P}(0), \mathrm{P}(1)$, $\mathrm{P}(2)$, and/or $\mathrm{P}(3)$ )
- Proportions of students who did not respond to an item (denoted as $\mathrm{P}(-)$ )
- Indicators of item discrimination
- item-total correlations (denoted as PtBis)
- point-biserial correlation for each response option for MC items (denoted as $\operatorname{PT}(\mathrm{A}), \operatorname{PT}(\mathrm{B}), \operatorname{PT}(\mathrm{C})$, and PT(D))
- point-biserial correlation for each score point for EBSR and TE items (denoted as PT(0), PT(1), PT(2), and PT(3))

## ITEM DIFFICULTY

At the most general level, an item's difficulty is indicated by its mean score in some specified group (e.g., grade level).

$$
\bar{x}=\frac{1}{n} \cdot \sum_{i=1}^{n} x_{i}
$$

In the mean score formula above, the individual item scores (xi) are summed and then divided by the total number of students $(n)$. For MC items, student scores are represented by 0 s and $1 \mathrm{~s}(0=$ wrong, $1=$ right). With $0 / 1$ scoring, the equation above also represents the number of students correctly answering the item divided by the total number of students. So, this is also the proportion correct for the item, or as it is better known, the $p$-value. In theory, $p$-values can range from $0.00^{1}$ to 1.00 on the proportion-correct scale. For example, if an item has a $p$-value of 0.89 , it means 89 percent of the students answered the item correctly. Additionally, this value might also suggest that the item is relatively easy and/or the students who attempted the item are relatively high achievers. In other words, item difficulty and student ability are somewhat confounded.

[^10]For EBSR items, mean scores can range from the minimum possible score of zero to the maximum possible score of either two or three depending upon the item. Similarly, for TE items, mean scores can range from the minimum possible score of zero to the maximum possible score of either one or two depending upon the item. A pseudo $p$-value is provided for EBSR and TE items by dividing the mean item score by the maximum possible item score.

The minimum and maximum extremes of the difficulty scale are virtually never seen in applied practice. However, understanding what those values are helps illustrate that relatively lower values correspond to more difficult items and that relatively higher values correspond to easier items. (Because of this, some assert that this index would be better referred to as the item's easiness.)

Item difficulty is an important consideration for the Classroom Diagnostic Tools (CDT) because it is a computer adaptive test. The item selection routine selects items based on student performance during the test. While very easy or very difficult items may not be appropriate for many students, they are needed in the CDT item pools to ensure that the item selection routine can find appropriate items for students at various levels.

Utilizing the proportion of students who chose each MC option can be helpful for verifying keys. For example, if a large proportion of students chose a distractor instead of the key answer, it may, but not always, indicate the key is not correct.

## ITEM DISCRIMINATION

At the most general level, item discrimination ${ }^{2}$ indicates an item's ability to differentiate between high and low achievers. It is expected that students with high ability (i.e., those who perform well on the CDT overall) would be more likely to answer any given CDT item correctly, while students with low ability (i.e., those who perform poorly on the CDT overall) would be more likely to answer the same item incorrectly. For the CDT, Pearson's productmoment correlation coefficient between item scores and test scores is used to indicate discrimination. The correlation coefficient can range from -1.0 to +1.0 . If the aforementioned expectation is met (high-scoring students tend to get the item right while low-scoring students do not), the correlation between the item score and the total test score will be both positive and noticeably large in its magnitude (i.e., well above zero), meaning the item is a good discriminator between high- and low-ability students.

Item total correlation for each option is another indicator of an item's ability to differentiate between high and low achievers. It is expected that students with high ability (i.e., those who perform well on the CDT overall) would be less likely to choose any distractors, while students with low ability (i.e., those who perform poorly on the CDT overall) would be more likely to choose a distractor. In other words, the item total correlations for the distractors are expected to be negative.

In summary, the correlation will be positive in value when the mean test score of the students answering the item correctly is higher than the mean test score of the students answering the item incorrectly. ${ }^{3}$ In other words, this indicates that students who did well on the total test tended to do well on the item, as well. However, an interaction can exist between item discrimination and item difficulty. Items answered correctly (or incorrectly) by a large proportion of examinees (i.e., they have extreme $p$-values) can have reduced power to discriminate, and, thus, can have lower correlations.

Discrimination is an important consideration for the operational CDT because the use of more discriminating items on a test is associated with more precise score estimates (i.e., there will be smaller confidence intervals around the scores).

[^11]
## OBSERVATIONS AND INTERPRETATIONS

Table 7-1 provides the mean $p$-values and point-biserial correlations for the CDT item pools in each content area. The mean $p$-value ranged from 0.279 to 0.824 . The mean point-biserial correlations ranged from 0.155 to 0.491 .

It is difficult to make global conclusions about overall quality from these item statistics alone. With that caveat in mind, the results presented in this chapter indicate that the CDT item pools contain items within expected and acceptable ranges of item difficulty and discrimination.

## CHAPTER EIGHT: RASCH ITEM CALIBRATION

The particular item response theory (IRT) model used for the Classroom Diagnostic Tools (CDT) is based on the work of Georg Rasch. Rasch models have had a long-standing presence in applied testing programs and have been the methodology used to calibrate the Pennsylvania System of School Assessment (PSSA) items and Keystone Exam items. Consequently, this model was chosen to be used for the CDT. IRT has several advantages over classical test theory, so it has become the standard procedure for analyzing item response data in large-scale assessments. However, IRT models make a number of strong assumptions related to dimensionality, local independence, and model-data fit. Resulting inferences derived from any application of IRT rest strongly on the degree to which the underlying assumptions are met.

This chapter outlines the procedures used for calibrating the CDT items. Generally, item calibration is the process of assigning a difficulty-parameter estimate to each item so that they are placed onto a common scale. This chapter briefly introduces the Rasch model and reports the results from evaluations of the adequacy of the Rasch assumptions. See Chapter Nine for a description of the common scale across grades and courses within a content area and for summaries of the Rasch item statistics for the CDT item pools.

## DESCRIPTION OF THE RASCH MODEL

The Rasch partial credit model (RPCM) (Wright \& Masters, 1982) was used to calibrate CDT items because the item pools contain multiple item types. The RPCM extends the Rasch model (Rasch, 1960) for dichotomous multiplechoice $(0,1)$ items so that it accommodates the polytomous evidence-based selected-response and technologyenhanced items. Under the RPCM, for a given item $i$ with $m i$ score categories, the probability of person $n$ scoring $x$ ( $x=0,1,2, \ldots m i$ is given by:

$$
P_{n i}(X=x)=\frac{\exp \sum_{j=0}^{x}\left(\theta_{n}-D_{i j}\right)}{\sum_{k=0}^{m_{i}} \exp \sum_{j=0}^{k}\left(\theta_{n}-D_{i j}\right)}, x=0,1, \ldots, m_{i}
$$

where $\theta_{n}$ represents a student's proficiency (ability) level, and $D_{i j}$ is the step difficulty of the $j^{\text {th }}$ step on item $i$. For dichotomous MC items, the RPCM reduces to the standard Rasch model and the single step difficulty is referred to as the item's difficulty. The Rasch model predicts the probability of person n getting item i correct as follows:

$$
P_{n i}(X=1)=\frac{\exp \left(\theta_{n}-D_{i j}\right)}{1+\exp \left(\theta_{n}-D_{i j}\right)}
$$

The Rasch model places both student ability and item difficulty (estimated in terms of log-odds or logits) on the same continuum. When the model assumptions are met, it also provides person ability estimates that are independent of the items employed in the assessment, and, conversely, estimates item difficulty independently of the sample of examinees.

## SOFTWARE AND ESTIMATION ALGORITHM

Item calibration was implemented via the WINSTEPS 3.71 computer program (Linacre, 2009). The unconditional, joint maximum likelihood (UCON) estimation procedure estimates the person parameters (i.e., ability) simultaneously with the item parameters (i.e., difficulty).

## CHECKING RASCH ASSUMPTIONS

Because the Rasch model was the basis of all calibration, scoring, and scaling analyses associated with the CDT, the validity of the inferences from these results depends on the degree to which the assumptions of the model are met and how well the model fits the test data. Therefore, it is important to check these assumptions. This section evaluates the dimensionality of the data, local item independence, and model-data fit at the item level. Though a variety of methods are available for assessing these issues, the Rasch analyses and criteria available from WINSTEPS were used here.

## UNIDIMENSIONALITY

Rasch models assume that one dominant dimension determines the difference in students' performances. WINSTEPS provides results from a principal components analysis (PCA) that can be used to assess the unidimensionality assumption. Different from standard applications of PCA, WINSTEPS conducts its PCA on the response residuals, not the original observations. That is, the primary dimension from the Rasch model is removed first and then the residual variance is analyzed. The purpose of the analysis is to verify whether any other dominant components exist among the residuals (i.e., they account for a practically significant amount of residual variance). If any other dimensions are found, the unidimensionality assumption would be violated.

WINSTEPS provides three PCA residuals: raw, standardized, and logit. All three should yield similar results. The mixed residual setting was used for the PCA because previous research has demonstrated that raw residuals ( $\mathrm{PRCOMP}=\mathrm{R}$ ) give a more realistic estimate of explained variance than do standardized residuals (PRCOMP=S), and standardized residuals are better for decomposing the unexplained variance into contrasts (Linacre, 2009).

Table 8-1 presents the PCA results for the CDT Mathematics item pool. The results include the total variance, variance explained by the model, unexplained total variance, and unexplained variance explained by the first factor (both eigenvalue units and percentage values are shown in the table). In addition, the modeled column provides variance components that would be explained if the data complied with the Rasch definition of unidimensionality.

As can been seen from Table 8-1, the primary dimension in the Rasch model explained between 21 and 63 percent of the total variances across the grades and courses. The empirical and model-based percentages were close, suggesting that the estimation of a primary Rasch dimension was successful. The unexplained variances were between 38 and 79 percent. This includes the Rasch-predicted randomness and any departures in the data from the Rasch model (e.g., departure from unidimensionality).

The most important variance for evaluating dimensionality is in the row named "unexplained variance explained by 1st factor." The eigenvalue of unexplained total variance equals the total number of items, since PCA was conducted with residuals. The eigenvalues of the first factor in the residual (again, this is the second dimension beyond the first Rasch model dimension in WINSTEPS PCA) were between 0.2 and 1.1 percent. Overall, WINSTEPS PCA suggests that there is one clearly dominant dimension for the CDT mathematics item pool.

Table 8-2 presents the PCA results for the CDT reading item pool. The primary dimension in the Rasch model explained between 26 and 58 percent of the total variances across the grades and courses. The second dimension (the row named "unexplained variance explained by 1st factor") accounted for between 0.3 and 3.2 percent of the total variance in observations. These results suggest that the CDT reading item pool essentially measures a single dominant dimension.

*Items in kindergarten through grade 2 were co-mingled on forms taken by students in grade 3.

Table 8-3 presents the PCA results for the CDT science item pool. The primary dimension in the Rasch model explained between 20 and 68 percent of the total variances across the grades and courses. The second dimension (the row named "unexplained variance explained by 1st factor") accounted for between 0.3 and 4.6 percent of the total variance in observations. These results suggest that the CDT science item pool essentially measures a single dominant dimension.

*Grade 11 items were tested on Grade 8 forms.

Table 8-4 presents the PCA results for the CDT writing item pool. The primary dimension in the Rasch model explained between 22 and 55 percent of the total variances across the grades and courses. The second dimension (the row named "unexplained variance explained by 1st factor") accounted for between 0.3 and 2.2 percent of the total variance in observations. These results suggest that the CDT writing item pool essentially measures a single dominant dimension.

*Items in kindergarten through grade 2 were co-mingled on forms taken by students in grade 3.

## LOCAL INDEPENDENCE

Local independence (LI) is a fundamental assumption of IRT. No relationship should exist between examinees' responses to different items after accounting for the abilities measured by a test. In formal statistical terms, a test X that is comprised of items $\mathrm{X}_{1}, \mathrm{X}_{2}, \ldots \mathrm{X}_{\mathrm{n}}$ is locally independent with respect to the latent variable $\theta$ if, for all $\mathrm{x}=$ $\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots \mathrm{x}_{\mathrm{n}}\right)$ and $\theta$,

$$
P(\mathbf{X}=\mathbf{x} \mid \theta)=\prod_{i=1}^{I} P\left(X_{i}=x_{i} \mid \theta\right)
$$

This formula essentially states that the probability of any pattern of responses across all items ( $x$ ), after conditioning on the abilities measured by the test, should be equal to the product of the conditional probabilities across each item (cf. the multiplication rule for independent events where the joint probabilities are equal to the product of the associated marginal probabilities).

The equation above shows the condition after satisfying the "strong form" of local independence. A "weak form" of local independence (WLI) was proposed by McDonald (1979). The distinction is important, as many indicators of local dependency are actually framed by WLI. The requirement here would be for the conditional covariances of all pairs of item responses, conditioned on the abilities, to be equal to zero. When this assumption is met, the joint probability of responses to an item pair, conditioned on abilities, is the product of the probabilities of responses to these two items, as show below. (This is a "weaker" form because higher-order dependencies among items are allowed.) Based on the WLI, the following expression can be derived:

$$
P\left(X_{i}=x_{i}, X_{j}=x_{j} \mid \theta\right)=P\left(X_{i}=x_{i} \mid \theta\right) P\left(X_{j}=x_{j} \mid \theta\right) .
$$

Marais and Andrich (2008) pointed out that local item dependence in the Rasch model can occur in two ways that some may not distinguish. The first way occurs when the assumption of unidimensionality is violated. Here, other nuisance dimensions besides a dominant dimension also determine students' performance (this can be called "trait dependence"). The second violation occurs when responses to an item depend on responses to another. This is a violation of statistical independence and can be called "response dependence." Many people treat the assumptions of "unidimensionality" and "local independence" as one phenomenon and believe that once unidimensionality holds, that local independence also holds. By distinguishing the two sources of local dependence, one can see that while local independence can be related to unidimensionality, the two are different assumptions, and, therefore, require different tests.

Residual item correlations provided in WINSTEPS for each item pair were used to assess the local dependence among the CDT items. In general, these residuals are computed as follows. First, expected item performance based on the Rasch model is determined using ability and item parameter estimates. Next, deviation (residual) between the examinees' expected and observed performance is determined for each item. Finally, for each item pair, a correlation between the respective deviations is computed.

As previously mentioned, three types of residual correlations are available in WINSTEPS: raw, standardized, and logit. Since the three residual correlations are very similar, the default "standardized residual correlation" in WINSTEPS was used for these analyses. Tables 8-5 through 8-8 show the summary statistics-mean, standard deviation (SD), minimum (Min), maximum (Max), and several percentiles (P10, P25, P50, P75, P90) - for all the residual correlations for each content area and grade/course. The total number of item pairs ( N ) and the number of pairs with the residual correlations greater than 0.20 are also reported in the tables.

Table 8-5. Summary of Item Residual Correlations for Mathematics

Across the content areas and grades/courses, the mean residual correlations were slightly negative and the values were close to zero. The vast majority of the correlations were very small, suggesting local item independence generally holds for the CDT mathematics, reading, science, and writing item pools.

## ITEM FIT

WINSTEPS provides two item-fit statistics (infit and outfit) for evaluating the degree to which the Rasch model predicts the observed item responses. Each fit statistic can be expressed as a mean square ( MnSq ) statistic or on a standardized metric (Zstd with mean $=0$ and variance $=1$ ). MnSq values are more oriented toward practical significance, while Zstd values are more oriented toward statistical significance. MnSq values are presented in this chapter.

Both infit and outfit MnSq are the average of standardized residual variance (the difference between the observed score and the Rasch estimated score divided by the square root of the Rasch model variance). The difference is that the outfit statistic gives all examinees equal weight in computing the fit and tends to be affected more by unexpected responses far from the person, item, or rating scale category measure (i.e., it is more sensitive to outlying, off-target, low information responses). The infit statistic is weighted by the examinee locations relative to item difficulty and tends to be affected more by unexpected responses close to the person, item, or rating scale category measure (i.e., informative, on-target responses). Some feel that extreme infit values are a greater threat to the measurement process than extreme outfit values since most tests intend to measure the on-target population rather than extreme outliers.

The expected MnSq value is 1.0 , and it can range from 0 to infinity. Deviation in excess of the expected value can be interpreted as noise or lack of fit between the items and the model. Values lower than the expected value can be interpreted as item redundancy or overfitting items (too predictable, too much redundancy), and values greater than the expected value indicate underfitting items (too unpredictable, too much noise). Rules of thumb regarding practically significant MnSq values vary. More conservative users might prefer items with MnSq values that range from 0.8 to 1.2. Others believe reasonable test results can be achieved with values from 0.5 to 1.5. In the following results, values outside of 0.7 to 1.3 are given practical importance.

Table 8-9 presents the summary statistics of infit and outfit mean square statistics for the CDT item pools, including the mean, standard deviation, minimum, and maximum values. The number of items within the range of ( $0.7,1.3$ ) is also reported in Table 8-9. As can been seen, the mean values for both fit statistics were close to 1.00 for nearly all grades/courses. Nearly all items had infit values falling in the range of $(0.7,1.3)$. These results indicate that the Rasch model fits the CDT data well.

Table 8-9. Summary of Infit and Outfit Mean Square Statistics

| Date | Content Area | Grade/Course | Number of Items | Infit <br> Mean | $\begin{aligned} & \text { Infit } \\ & \text { SD } \end{aligned}$ | Infit <br> Min | Infit <br> Max | $\begin{array}{r} \text { Infit } \\ {[0.7,1.3]} \end{array}$ | Outfit <br> Mean | Outfit SD | Outfit Min | Outfit <br> Max | $\begin{array}{r} \text { Outfit } \\ {[0.7,1.3]} \end{array}$ |

## RASCH ITEM STATISTICS

As noted earlier, the Rasch model expresses item difficulty (and student ability) in units referred to as logits, rather than on the percent-correct metric. In the simplest case, a logit is a transformed $p$-value with the average $p$-value becoming a logit of zero. In this form, logits resemble $z$-scores or standard normal deviates; a very difficult item might have a logit of +4.0 and a very easy item might have a logit of -4.0 . However, they have no formal relationship to the normal distribution.

The logit metric has several mathematical advantages over $p$-values. Logits have an interval scale, meaning that two items with logits of 0.0 and +1.0 , respectively, are the same distance apart as two items with logits of +3.0 and +4.0. Logits are not dependent on the ability level of the students. For example, a test form can have a mean logit of zero, whether the average item $p$-value for the student sample is 0.8 or 0.3 .

The standard Rasch calibration procedure arbitrarily sets the mean difficulty of the items in any calibration at zero. For each CDT stand-alone field-test event and content area, all grades and courses were calibrated separately with the exception of grade 11 items in Mathematics and Science. As a result, items in each grade or course were centered at zero. See Chapter Nine for a description of how item parameters within a content area were re-scaled across grades and courses to build a single (vertical) scale.

For each CDT embedded field-test event and content area, field-test items were calibrated anchoring on operational items' parameters. As a result, the embedded field-test items were placed on operational vertical scale.

Appendix B provides Rasch item difficulty measure on the vertical scale and associated standard error for all items field tested in 2019-2020. Statistics for all items field tested in 2018-2019 can be found in Appendix B of the 2018-2019 technical report. Statistics for items field tested prior to 2018-2019 can be found in Appendix B of the 2017-2018 technical report.

## CHAPTER NINE: VERTICAL LINKING

The Classroom Diagnostic Tools (CDT) is designed to enable educators to identify students' academic strengths and areas of need. As such, it is necessary for some students to take items out of grade or course level. In order to do this, all items within a content area must be on a common (vertical) scale.

As previously mentioned in Chapter Eight, items from the first stand-alone field-test event for each CDT content area and grade or course were calibrated separately and centered at zero. This chapter outlines the procedures used for vertically linking CDT items across grades and courses within a content area. The end results are four separate vertical scales-one for each content area.

Also mentioned in Chapter Eight, for each content area, the items from all embedded field-test events and the second stand-alone field-test event were calibrated anchoring on operational items' parameters. As a result, all field-test items after the first stand-alone field-test events were placed on the operational vertical scale.

## VERTICAL LINKING DESIGN

The first CDT stand-alone field tests were designed to build vertical scales across all grades and courses within a content area. In order to accomplish this, some field-test forms had items from one grade above or below in addition to on-grade or course-level items.

Stand-alone field tests in each content area had two types of forms:

1. Vertical linking form
2. On-grade-only form

Students who received vertical linking forms took a set of on-grade items and a set of items either one grade above or one grade below. Students who received on-grade-only forms took just on-grade items.

All items in the pool were field tested on one or more forms. In Mathematics, on-grade items were chained across adjacent forms to provide a horizontal link across forms within a grade. There were eight to ten horizontal links across adjacent forms. In all other content areas, 10 on-grade items appeared on each form within a grade or course. These common items provide a horizontal link across forms within a grade. ${ }^{1}$

Items used in vertical linking were administered to students one grade above or one grade below in order to link the forms across grades. DRC test development specialists selected items to be administered off-grade level with the following guidelines:

- There are two types of linking sets.
- Items administered one grade below (e.g., grade 7 items administered to grade 6 students).
- Items administered one grade above (e.g., grade 7 items administered to grade 8 students).
- Linking sets span the diagnostic categories.
- Linking sets span the estimated difficulty range (item developers estimate easy, medium, or hard).
- Students have a reasonable chance of correctly answering a linking item based on the instruction received.
- For items administered in the grade above, students should have received instruction the previous year.
- For items administered in the grade below, they should be extensions of concepts the students have already covered, not something completely new.

[^12]In Mathematics, each set of linking items appeared on two forms, once located at the beginning and once located at the end to counterbalance possible position effect. In all other content areas, vertical linking items were comingled throughout the form with on-grade items. ${ }^{2}$

See Tables 6-1 through 6-4 in Chapter Six for details on the stand-alone field tests including number of items, number of forms, and number of vertical linking forms.

## VERTICAL LINKING - MATHEMATICS

Links were made between adjacent grades, grade 8 to Algebra I, Algebra I to Algebra II, and grade 8 to Geometry. Table 9-1 below shows the number of linking items from the lower grade and the upper grade for each link. There were two sets of linking items for each link and direction. For example, in linking grade 5 to grade 6, there were 30 grade 5 items (lower grade) and 20 grade 6 items (upper grade). The 30 grade 5 items were in two sets of 15, while the 20 grade 6 items were in two sets of 10 . The number of linking items differs across grades because forms in grades 3,4 , and 5 had 25 items total while all of the others had 35 . There was no overlap of linking items among the sets.

Table 9-1. Mathematics Linking Item Detail

| Link | Lower Grade | Upper Grade | Total |
| :--- | ---: | ---: | ---: |
| Grade 3 to Grade 4 | 20 | 20 | 40 |
| Grade 4 to Grade 5 | 20 | 20 | 40 |
| Grade 5 to Grade 6 | 30 | 20 | 50 |
| Grade 6 to Grade 7 | 30 | 30 | 60 |
| Grade 8 to Grade 7 | 30 | 30 | 60 |
| Algebra I to Grade 8 | 30 | 30 | 60 |
| Algebra II to Algebra I | 30 | 30 | 60 |
| Geometry to Grade 8 | 30 | 30 | 60 |

A visual representation of the vertical linking design is provided in Table 9-2. Rows are item level and columns are forms. For example, looking at the second row, you can see grade 4 items were on grades 3,4 , and 5 forms. Grade 4 items on grade 4 forms were on-grade items. Grade 4 items on grade 3 and grade 5 forms were vertical linking items. These items also appeared on grade 4 forms and were used to calculate the vertical linking shift parameter.

In linking grades 4 and 5, look at the four cells in Table $9-2$ where grade 4 and grade 5 rows and columns cross. There were 86 grade 4 items, and of those 86 items, 20 items were also given to grade 5 as linking items. Similarly, there were 85 grade 5 items, and 20 out of the 85 items were given to grade 4 students as linking items.

Items used to link to a lower grade were different from items used to link to an upper grade. For example, the 30 grade 7 items administered on grade 6 forms were not the same as the 30 grade 7 items administered on grade 8 forms.

[^13]Table 9-2. Mathematics Vertical Linking Design of Forms

| Gr. 3 Forms | Gr. 4 Forms | Gr. 5 Forms | Gr. 6 Forms | Gr. 7 Forms | Gr. 8 Forms | Alg I Forms | Geo Forms | Alg II Forms |

See Appendix C for details related to vertical linking items such as $n$-counts, Eligible Content, and diagnostic categories.

## VERTICAL LINKING - READING

Links were made between adjacent grades and grade 8 to Literature. Table $9-3$ shows the number of linking items from the lower grade and the upper grade for each link. There were two sets of linking items for each link and direction. For example, in linking grade 5 to grade 6, there were 20 grade 5 items (lower grade) and 20 grade 6 items (upper grade). The number of linking items was the same across grades.

## Table 9-3. Reading Linking Item Detail

| Link | Lower Grade | Upper Grade | Total |
| :--- | ---: | ---: | ---: |
| Grade 3 to Grade 4 | 20 | 20 | 40 |
| Grade 4 to Grade 5 | 20 | 20 | 40 |
| Grade 5 to Grade 6 | 20 | 20 | 40 |
| Grade 6 to Grade 7 | 20 | 20 | 40 |
| Grade 8 to Grade 7 | 20 | 20 | 40 |
| Literature to Grade 8 | 20 | 20 | 40 |

A visual representation of the vertical linking design is provided in Table 9-4.
Table 9-4. Reading Vertical Linking Design of Forms

See Appendix C for details related to vertical linking items such as $n$-counts, Eligible Content, and diagnostic categories.

## VERTICAL LINKING - SCIENCE

Links were made between adjacent grades, grade 8 to Biology, and grade 8 to Chemistry. Table 9-5 below shows the number of linking items from the lower grade and the upper grade for each link. There were two sets of linking items for each link and direction. For example, in linking grade 5 to grade 6, there were 20 grade 5 items (lower grade) and 20 grade 6 items (upper grade). The number of linking items was the same across grades.

Table 9-5. Science Linking Item Detail

| Link | Lower Grade | Upper Grade | Total |
| :--- | ---: | ---: | ---: |
| Grade 3 to Grade 4 | 20 | 20 | 40 |
| Grade 4 to Grade 5 | 20 | 20 | 40 |
| Grade 5 to Grade 6 | 20 | 20 | 40 |
| Grade 6 to Grade 7 | 20 | 20 | 40 |
| Grade 8 to Grade 7 | 20 | 20 | 40 |
| Biology to Grade 8 | 20 | 20 | 40 |
| Chemistry to Grade 8 | 20 | 20 | 40 |

A visual representation of the vertical linking design is provided in Table 9-6.
Table 9-6. Science Vertical Linking Design of Forms

See Appendix C for details related to vertical linking items such as $n$-counts, Eligible Content, and diagnostic categories.

## VERTICAL LINKING - WRITING

Links were made between adjacent grades and grade 8 to English Composition. Table 9-7 shows the number of linking items from the lower grade and the upper grade for each link. There were two sets of linking items for each link and direction. For example, in linking grade 5 to grade 6, there were 20 grade 5 items (lower grade) and 20 grade 6 items (upper grade). The number of linking items was the same across grades.

Table 9-7. Writing Linking Item Detail

| Link | Lower Grade | Upper Grade | Total |
| :--- | ---: | ---: | ---: |
| Grade 3 to Grade 4 | 20 | 20 | 40 |
| Grade 4 to Grade 5 | 20 | 20 | 40 |
| Grade 5 to Grade 6 | 20 | 20 | 40 |
| Grade 6 to Grade 7 | 20 | 20 | 40 |
| Grade 8 to Grade 7 | 20 | 20 | 40 |
| English Composition to Grade 8 | 20 | 20 | 40 |

A visual representation of the vertical linking design is provided in Table 9-8.

See Appendix C for details related to vertical linking items such as $n$-counts, Eligible Content, and diagnostic categories.

## THE VERTICAL LINKING PROCEDURE

Each of the CDT content area vertical scales was centered at grade 7. Adjacent-grade shift parameters were calculated and applied such that all items were vertically linked to grade 7 . For example, grade 4 science items were placed on the science vertical scale by applying three shift parameters:

- shift between grades 4 and 5 science
- shift between grades 5 and 6 science
- shift between grades 6 and 7 science

The steps used to calculate adjacent-grade shift parameters are described below. All item calibrations were done with WINSTEPS software version 3.71 (Linacre, 2009). The grade 4 to grade 5 link is provided as an example for the steps.

1. Calibrate all on-grade items.

- Calibrate grade 4 items on grade 4 forms.
- Calibrate grade 5 items on grade 5 forms.

2. Calibrate off-grade items anchoring on the on-grade items. Anchor values come from step 1.

- Calibrate grade 5 items on grade 4 forms anchoring on item parameters determined in grade 4 calibration in step 1.
- Calibrate grade 4 items on grade 5 forms anchoring on item parameters determined in grade 5 calibration in step 1.

Note: For the linking between grades 4 and 5, the calibration of off-grade items on grade 4 forms includes only grade 5 items. It does not include grade 3 items that appeared on grade 4 forms. That is, grade 3 and grade 5 items that appeared on grade 4 forms are not calibrated together.

For each of the linking items, there are two estimates of item difficulty-one from each of the two calibrations. Correlation between these should be high. If not, vertical linking will be problematic.
3. Calculate the difference between the two estimates of item difficulty from step 2 for each linking item. The average of these differences is the adjacent grade shift parameter.

- If grade is less than 7, determine the shift parameter needed to place items on upper grade scale.
- If grade is greater than 7, determine the shift parameter needed to place items on lower grade scale.
- Calculate the difference in item difficulty estimates between step 2, bullet 1 (grade 4 scale) and step 2, bullet 2 (grade 5 scale). An example of an Excel table used for calculations can be found in Appendix C.

4. Apply the adjacent grade shift parameter and plot the linking items along with a $45^{\circ}$ line. Figure $9-1$ below is an example. The $45^{\circ}$ line is for visual reference only. Outliers are NOT identified by comparing to the line. See step 5 for details.

Figure 9-1. Sample of Linking Items Plot
CDT Science: Grade 4 to Grade 5 Linking - All Links

Plots for all adjacent grade links can be found in Appendix C.
5. Determine if any items should be removed from the vertical linking process. Identify potential outliers using a combination of correlation, ratio of standard deviation, and robust Z. Discuss these items with test development specialists to determine if they should be removed. An item may be removed from the linking process and still remain in the item pool. In this case, the item is not removed from the on-grade calibrations. That is, do not re-run calibrations in step 1. Repeat steps 2 through 4.
6. Calculate the final shift parameter to the base grade (center of scale) by chaining together adjacent grade shift parameters

- Grade 7 is the base grade. The final shift parameter for grade 4 items is the shift parameter between grades 4 and 5 plus the shift parameter between grades 5 and 6 plus the shift parameter between grades 6 and 7 .

7. Apply the final shift parameters in step 6 to the item parameters calibrated in step 1.

## VERTICAL LINKING RESULTS

Table 9-9 shows the number of links, correlation, and shift parameter for the both the initial and final vertical linking for each content area. Initial vertical linking includes all items. Final values were determined after some links were dropped after consultation with test development specialists.

Table 9-9. Vertical Linking Summary

| Content Area | Link | Number of Links Initial | Number of Links Final | Correlation Initial | Correlation Final | Parameter <br> Initial | Parameter <br> Final |

Recall that for each content area the vertical scale is centered at grade 7. If the item's grade is less than 7, the shift parameter is the value that is added to place the item on the upper grade scale. For example, -1.212 is added to each grade 3 mathematics item's difficulty to place them on the grade 4 scale. The negative sign indicates that grade 3 items are less difficult than grade 4 items. If the item's grade is greater than 7 , the shift parameter is the value added to place the item on the lower grade scale. For example, 0.301 is added to each grade 8 mathematics item's difficulty to place them on the grade 7 scale. The positive sign indicates that grade 8 items are more difficult than grade 7 items.

Items dropped from vertical linking are shown in Table 9-10. Linking plots in Appendix C show all linking items with dropped items in red.

Table 9-10. Items Dropped from Vertical Linking

| Content Area | Link | Linking Items Removed |

*The grade 11 item was embedded on an Algebra I form
The final shift parameters were calculated by summing adjacent grade shift parameters. For example, grade 4 items were placed on the vertical scale by applying the grade 4 to grade 5 shift, the grade 5 to grade 6 shift, and the grade 6 to grade 7 shift. Similarly, Algebra I items were placed on the vertical scale by applying the Algebra I to grade 8 shift and the grade 8 to grade 7 shift. Table $9-11$ shows the final shift parameters for each content area.

Table 9-11. Final Vertical Linking Shift Parameters

| Content Area | Grade/Course | shift |

|  |  |  |

The final vertical linking shift parameters for grade 7 in each content area is zero because it is the base grade. The final vertical linking parameter applied to grade 11 items in mathematics and science is based on the grade or course where the items were field tested. For example, the Algebra I vertical linking constant is applied to grade 11 mathematics items which appeared on Algebra I forms.

## BANKED ITEM PARAMETERS FROM STAND-ALONE FIELD TESTS

Table 9-12 provides summary information based on the first stand-alone field-test events which were used to establish the content area vertical scales. The table shows the mean, standard deviation, minimum, and maximum of the item parameter estimates for each grade or course level on the content area vertical scales.

Table 9-12. Summary Statistics for Vertically Scaled Item Parameters from Stand-alone Field Test

| Content Area | Grade/Course | Mean | SD | Min | Max |

Figures 9-2 through 9-5 show the banked item parameter estimates following the first stand-alone field-test events for each grade or course on the content area vertical scales.

Figure 9-2. Mathematics Item Parameters Estimates from Stand-alone Field Test

Figure 9-3. Reading Item Parameters Estimates from Stand-alone Field Test

Figure 9-4. Science Item Parameters Estimates from Stand-alone Field Test

Figure 9-5. Writing Item Parameters Estimates from Stand-alone Field Test

Rasch item difficulty measure on the vertical scale and associated standard error for all items from the initial standalone field tests are presented in Appendix B of the 2017-2018 technical report.

## BANKED ITEM PARAMETERS FOR THE 2019-2020 OPERATIONAL ITEM POOLS

A number of changes to the CDT item pools have occurred since the initial stand-alone field-test events and creation of the content area vertical scales. For example, there have been embedded field test events to augment the item pools as well as introduce items in kindergarten, grade 1, and grade 2. (See Chapter Six for details on the various field-test events.) Additionally, prior to the 2013-2014 school year CDT items in mathematics, reading, and writing were re-aligned to the new Pennsylvania Core Standards. Table 9-13 provides summary information based on the operational item pools for the 2019-2020 school year. The table shows the mean, standard deviation, minimum, and maximum of the item parameter estimates for each grade or course level on the content area vertical scales.

Table 9-13. Summary Statistics for Vertically Scaled Item Parameters for 2019-2020 School Year

| Content Area | Grade/Course | Mean | SD | Min | Max |
| :---: | :---: | :---: | :---: | :---: | :---: |

Figure 9-8. Science Item Parameters Estimates for 2019-2020 School Year

Figure 9-9. Writing Item Parameters Estimates for 2019-2020 School Year

Rasch item difficulty measure on the vertical scale and associated standard error for all operational items are presented in Appendix B of the 2017-2018 and 2018-2019 technical reports.

## CHAPTER TEN: BENCHMARKING

As described in Chapter Fourteen, CDT scores are placed along a continuum from "Areas of Need" to "Strengths to Build On." These are represented in the dynamic reporting suite with colors red, green, and blue. "Areas of Need" are depicted in the red range, while "Strengths to Build On" are depicted in the green and blue ranges. The center of the green range is the point that separates students into two categories: solidly ready for the next grade or course and not solidly ready for the next grade or course. In each content area, the center of the green range for grades 5 and above was established by panels of Pennsylvania educators during benchmarking activities ${ }^{1}$.

## BENCHMARKING ACTIVITIES

Table 10-1 below presents general information about the preliminary benchmarking activities for mathematics, reading, science, and writing. The cut points established are considered preliminary because they were set prior to the first operational administration of the CDT. This was necessary so teachers and students would have access to immediate scores and reports following operational administration. As operational data become available, preliminary cut points are reevaluated and possibly revised (see Chapter Nineteen for details including the benchmark cuts in place for the 2019-2020 school year).

Table 10-1. General Information about CDT Benchmarking Activities

| Category | Information |
| :--- | :--- |
| Event Date | Mathematics: August 12-13, 2010 |
| Event Date | Reading: January 27-28, 2011 |
| Event Date | Science: January 27-28, 2011 |

| Categories | Solidly ready for the next grade or course |
| Number of Panelists | Mathematics: 28 |
| Number of Panelists | Reading: 23 |
| Number of Panelists | Science: 20 |
| Number of Panelists | Writing: 46 |
| Rounds | Two |

There were three separate CDT benchmarking events because the operational CDT was rolled out in phases by content area. Each benchmarking event followed the initial stand-alone field-test event for that content area.

When initially launched, the CDT was available to students in grades 6 and above. However, cut points were established for grades 5 and above. This is because CDT is available throughout the school year. Early in the school year it may be more appropriate to evaluate a student's scores based on the prior grade cut. For example, in October, a teacher may choose to evaluate a grade 6 student's scores relative to the grade 5 cut.

[^14]The Randomly Ordered Item Booklet (ROIB) Angoff (Yes/No) method was used to set CDT benchmark cut points. Panels of educators worked in grade/course groups to establish cut points for grades 5 through 8, high school, and content area courses Algebra I, Geometry, Algebra II, Literature, Biology, Chemistry, and English Composition. After a training session describing the process and definition of roles, a discussion was held in which panelists were asked to describe what "solidly ready for the next grade or course" means. Thereafter, panelists were asked to review approximately 40 test questions and make individual yes/no judgments as to whether a "solidly ready" student would be successful in answering each question. The judgments were made over two iterations or rounds with a sequence of Round 1 judgments, show and verification of Round 1 results, group discussion, and Round 2 judgments.

After cut points were set for each grade and course within a content area, the vertical articulation of cut points across grades and courses was reviewed. Given that each content area is vertically scaled, it was expected that cut points would increase as grade increased. For example, the grade 8 cut point would not be lower than the grade 7 cut point on the vertical scale. In some cases, post-smoothing was required to ensure increasing cut points across grades/courses and smooth transitions.

Complete descriptions of each benchmarking activity including post-smoothing are available in TAC documents:

- Classroom Diagnostic Tools—Results for Preliminary Benchmarking Activity—Mathematics
- Classroom Diagnostic Tools—Results for Preliminary Benchmarking Activity—Reading and Science
- Classroom Diagnostic Tools—Results for Preliminary Benchmarking Activity—Writing

## BENCHMARKING RESULTS

Preliminary cut points in the logit metric for each content area are shown in Figures 10-1 through 10-4. In general, the difference between cut points is greater in the lower grades and then levels off.

Figure 10-1. Preliminary Benchmark Cut Points for Mathematics

Figure 10-2. Preliminary Benchmark Cut Points for Reading

Figure 10-3. Preliminary Benchmark Cut Points for Science

Figure 10-4. Preliminary Benchmark Cut Points for Writing

Table 10-2 shows the preliminary benchmark cuts in the logit metric for each content area. Also presented are the scale score ranges for each color on the CDT reports.

Table 10-2. Preliminary Benchmark Cuts and Scale Score Ranges
$\left.\begin{array}{|l|l|r|r|r|r|}\hline \text { Content Area } & \text { Grade or Gourse } & \begin{array}{r}\text { Logit Gut Point } \\ \text { (Center of } \\ \text { Green) }\end{array} & \begin{array}{r}\text { Red } \\ \text { Scale Score Range }\end{array} & \begin{array}{r}\text { Glueen } \\ \text { Scale Score Range }\end{array} \\ & & -0.292 & 400-895 & 896-1058 & 1059-2000 \\ \hline \text { Scale Score Range }\end{array}\right]$

## CHAPTER ELEVEN: SCALING

Scaling is used to transform test score values onto a scale that can be interpreted by users easily and correctly. Raw scores cannot be used to compare students' achievement on the CDT because they depend on the difficulty of the test items administered. Given the adaptive nature of the CDT, each student receives test items targeted at his or her level of achievement. Therefore, two students may have taken very different sets of items in terms of difficulty but have the same raw score. This makes use of raw scores for comparison across students, across administrations, or to a specific standard (cut point) meaningless. Rasch ability estimates in the logit metric do take into consideration the difficulty of the items administered. Therefore, they may be used to make comparisons. However, scale scores are introduced to report CDT results since scale scores may be easier to understand and interpret than logits.

Essentially, CDT scale scores are derived through a two-step process. First, there is a nonlinear transformation that converts an individual raw score on a unique set of items to Rasch ability (in logits). Second, a linear transformation is used to convert logits to scale scores. These and some additional considerations (e.g., rounding rules) are discussed in more detail below.

## RAW SCORES TO RASCH ABILITY ESTIMATES

For each CDT test, the calibrated item difficulties associated with the unique set of items administered were used to obtain Rasch person ability estimates and asymptotic standard errors of measurement for the overall test, as well as each diagnostic category. Calibrated item difficulties were based on the field tests and vertical linking (further discussed in Chapter Eight and Chapter Nine).

Raw scores (total and diagnostic category) on the unique set of items that makes up an individual CDT test were mapped to Rasch ability estimates using unconditional, joint-maximum likelihood estimation. In the case of zero or perfect raw scores, a fractional raw score (a value less than one) was added to zero scores and subtracted from perfect scores to determine the corresponding logit values for these extreme scores. The Rasch ability estimates were then transformed to scale scores as discussed in the next section.

## RASCH ABILITY ESTIMATES TO SCALE SCORES

Generally, scale scores are preferred over Rasch ability estimates for reporting purposes. One issue is that Rasch ability estimates are on a scale that includes negative and decimal values. By transforming the Rasch ability estimates to scale scores, all reported values can become positive integers, which makes more sense to teachers, parents, and students. Since Rasch ability estimates are comparative, the transformed scale scores have a common scale across administrations.

Scale scores are usually obtained through some linear transformation of Rasch ability estimates. Before the linear equation was established for each content area, a few points were considered for the CDT:

- Avoid scales that might be confused with scores for other types of assessment; for example:
- Scale scores ranging from 0 to 100 (because this might be confused with percent correct scores or percentile ranks)
- Scale scores ranging from 200 to 800 (because this might be confused with SAT scores)
- Scale scores with similar ranges as the ones for the Pennsylvania System of School Assessment (PSSA) or Keystone Exams
- Avoid scales similar to raw scores.
- Avoid scales that might suggest the scores are more precise than they actually are (in other words, suggesting more precision than can be supported by the test scores).
- Avoid scales with negative numbers and decimals.

In terms of industry standard practice, a common perspective is that scale scores should facilitate score interpretation while at the same time minimize misinterpretation and unwarranted inferences. Often this is done by incorporating some kind of meaning to the scores ${ }^{1}$ (Peterson, Kolen, and Hoover, 1989). The incorporation of content meaning is one way to facilitate score interpretation. This might be done in several different ways. For example, PSSA scaled scores, like those of many other state assessments, try to input some content meaning by having the PSSA performance level cut scores have known values on the scaled score metric. Such an approach appears to make good sense given the purposes of the criterion-reference test like the PSSA.

For CDT, the scale must be sufficiently large to cover the entire vertical scale. As a result, an initial scale score range of 400 to 2000 was established for each content area. When CDT was expanded in spring of 2014 and made available to students in grades 3 through 5, the scale score range was expanded to 200 to 2000 for those students. Initially, the grade 7 benchmark logit cut point was mapped to a scale score of 1200 for all content areas. It is worth noting that, although careful consideration was given to the selection of these values, they are completely arbitrary. For example, the label of 1200 could have been called 100 or any other value without affecting any of the relationships among schools, administrations, students, or items. In other words, changing the scale would simply be changing the labels on the axis of a graph without moving any of the points.

## LINEAR TRANSFORMATION FORMULAS

The scale scores for the CDT for each content area are obtained through a linear transformation of the Rasch ability estimates ( $\hat{\beta}$ ). Specifically,

$$
S S=m \hat{\beta}+b,
$$

where $m$ is the slope and $b$ is the intercept. The linear transformation for each CDT content area was derived by anchoring the grade 7 benchmark cut (i.e., Rasch ability estimate) to the scale score 1200 and a Rasch ability estimate of 7.9 to the scale score of 2000 . The slopes of the scaling equations influence the variability of the scale scores. It is important that the slopes are sufficiently large to cover the full range of the vertical scale. The CDT scaling equations produce scale score distributions with standard deviations of approximately 150 scale score points and cover logit ranges of approximately -6.5 to 7.9. The final slopes and intercepts for deriving scale scores for the CDT are provided in Table 11-1.

Table 11-1. Scaling Constants by Content Area

| Content Area | Slope | Intercept |
| :--- | ---: | ---: |
| Mathematics | 124.90 | 1013.30 |
| Reading | 142.83 | 871.63 |
| Science | 132.87 | 950.34 |
| Writing | 133.02 | 949.12 |

## ROUNDING

The linearly transformed scale scores are rounded to the nearest integer value for reporting purposes. Values greater than or equal to 0.50 are rounded up. Values less than 0.50 are rounded down.

[^15]
## LOWEST OBTAINABLE SCALE SCORES

Each general content area CDT (mathematics, reading, science, and writing) has a lowest obtainable scale score (LOSS) of 200. Course specific CDTs (Algebra I, Geometry, Algebra II, Biology, and Chemistry) have a lowest obtainable scale score (LOSS) of 400. Any derived scale score less than LOSS is truncated to this minimum value. The selection of a LOSS is mainly based on two considerations:

1. Extremely low scale scores may have an impact on the average of the scale scores if CDT data is summarized at school, district, or state level.
2. Score truncation makes sense from a score precision perspective given measurement errors at the extremes are large.

## HIGHEST OBTAINABLE SCALE SCORES

A highest obtainable scale score (HOSS), 2000, is set for the CDT for the same reasons as described for the LOSS value.

## CHAPTER TWELVE: EQUATING

Equating is a statistical process that is used to adjust scores on test forms so that scores on the forms can be used interchangeably (Kolen \& Brennan, 2004), even though the test forms consist of different items. In the case of the CDT, the adaptive nature of the test means that each student takes a unique test form with items targeted at his or her level of achievement.

To make meaningful comparisons of test scores across administrations, various equating models and procedures have been developed in the literature. For example, in terms of design, there are randomly equivalent groups design and common-item non-equivalent groups design. In terms of testing model, the model can be classified as either classical test theory based equating model or modern test theory (e.g., Rasch model or item response theory) based equating model. In terms of when the equating is conducted in the assessment cycle, the model can be classified as pre-equating or post-equating.

Given the requirements of adaptive testing and immediate score reporting, CDT is pre-equated. Also, it was based on the Rasch model. The following sections will focus on the discussion of pre-equating and the equating design for the CDT.

## PRE-EQUATING VERSUS POST-EQUATING

Like other Pennsylvania assessment programs, the CDT uses the Rasch model to guide test design, calibration, scaling, and equating. The key element of equating test forms using the Rasch model is to place the item parameters on the same scale. Once this is done, raw scores can be converted to Rasch ability estimates and then to scale scores as described in Chapter Eleven. As a result, the scale scores can be compared across forms and administrations with different items.

A common practice in many K-12 large-scale assessment programs is to have all the items field tested before they are administered in an operational setting. Once the field-test items' difficulties are placed on the base scale or common metric, in theory, one should not expect the Rasch item difficulties for these items to change, except within a reasonable range of measurement error, after they are administered in an operational test, providing the Rasch model fits the data. Based on this theoretical advantage of using Rasch models, equating can be conducted using the item parameters calibrated from field-test data. This statistical procedure is referred to as pre-equating. In contrast, post-equating involves the use of Rasch item difficulties calibrated from the data of the operational test to be equated.

Although, in theory, the two equating procedures should provide identical results when the model fits the data, each of them has its own advantages and disadvantages. The use of pre-equating can facilitate the operational process in terms of adaptive item selection, rapid or immediate score reporting, and more flexibility in the assessment. However, a variety of issues need to be considered when using pre-equating in practice. For example, students may not be motivated to take the field tests, especially stand-alone field tests, which may make the items appear harder in the field test than in the operational test (Eignor, 1985; Eignor and Stocking, 1986; Stocking and Eignor, 1986; Kolen and Harris, 1990). Other concerns for the field-test items include item context, item position, and sample size. In contrast, the use of post-equating, when applicable, does not have the same motivational concerns because students cannot distinguish between operational and field-test items. Also, post-equating is sometimes considered to yield more accurate analysis results given the large number of students who take the operational tests. On the other hand, post-equating does not allow for adaptive item selection or immediate score reporting as required of the CDT.

## EQUATING DESIGN FOR THE CDT

The CDT is an adaptive test, meaning that the test items selected are tailored to each student's achievement as the test progresses. This requires that all items in the pool be on the same scale and known at the time of testing. For CDT, this is accomplished by vertical linking the entire item pool within a content area based on the field-test events. See Chapter Eight and Chapter Nine for details. The known (pre-equated) item parameters are used in selecting items targeted for the student and to provide immediate scores to teachers and students.

In implementing the pre-equating model for the CDT, efforts were made to enhance the accuracy of pre-equating results. To address the concerns on students' motivation to take field tests, records were excluded from item calibrations if the student did not answer at least 5 questions. Also, records with high person outfit mean-squares values were excluded following the WINSTEPS suggestion that these may be the result of a few random responses by low performers. To address concerns of sample sizes, windows for field testing were scheduled so they did not overlap other testing in an attempt to increase volunteer participation. Also, field-test windows were extended in cases where schools were unable to complete testing in the allotted time. A small study of mathematics vertical linking items revealed no position effects. However, it should be noted that with adaptive tests students do not take the same items. Even if two students do take the same item, it will likely not be in the same test position.

## EVALUATION OF ITEM PARAMETER STABILITY

After each school year, item parameter stability studies are conducted for each content area. If the differences between the newly estimated Rasch item difficulties and the estimates based on the field-test events are not statistically significant, the pre-equating results should be valid. See Chapter Eighteen for results of item parameter stability studies based on operational data from the 2019-2020 school year.

## EQUATING ADDITIONAL FIELD-TEST ITEMS

Over time, additional items have been, and will continue to be, needed to replenish the CDT item pools. Plans to field test additional items must include an equating plan. Equating is needed to place the new items onto the existing vertical scale. In the case of stand-alone field-test events, common-item equating was used. That is, field-test forms included items from the current CDT item pool. In the case of embedded field-test events, field-test items were included within an operational administration such that students did not know which items were field test. With both stand-alone and embedded field test, equating was accomplished by running the calibration of field-test items with item parameters of operational items fixed/anchored to the bank values using WINSTEPS. For each content area, the entire item pool, including field-test items, was calibrated using WINSTEPS with operational items anchored on the banked values.

## CHAPTER THIRTEEN: OPERATIONAL TEST DESIGN AND CAT CONFIGURATIONS

The Pennsylvania Classroom Diagnostic Tools (CDT) was initially developed to support teachers and students in grades 6 through 12. In spring 2014, CDT was made available to students in grades 3 through 5 as well. The tools are fully integrated and aligned in the Standards Aligned System (SAS) and enable educators to identify students' academic strengths and areas of need as well as provide links to classroom resources. The assessment is voluntary and administered completely online using a computer adaptive test (CAT) model.

The CDT features a number of tests. Tests in Mathematics, Algebra I, Geometry, and Algebra II were introduced in October 2010 for students in grades 6 and above. Tests in Reading/Literature, Science, Biology, and Chemistry were first available in April 2011 for students in grades 6 and above. Tests in Writing /English Composition began in October 2011 for students in grades 6 and above. Tests in Mathematics, Reading, Science, and Writing for students in grades 3 through 5 started in April 2014.

This chapter details the operational CDT test design and configuration of the CAT algorithm. Test design elements include the number of diagnostic categories, the number of operational items to administer per diagnostic category, and the number of embedded field-test items. CAT algorithm elements include entry point, item selection criteria, test navigation, and termination.

## OPERATIONAL TEST DESIGN

## NUMBER OF DIAGNOSTIC CATEGORIES

The CDT tests include multiple-choice (MC) and evidence-based selected-response (EBSR) items. All items in the content areas of mathematics, reading, and writing are aligned to the Pennsylvania Core Standards. All items in the content area of science are aligned to the Pennsylvania Academic Standards. Each CDT is broken into four or five diagnostic categories and the items in the pool are grouped by these diagnostic categories based on the Assessment Anchors and Eligible Content. The diagnostic categories for each of the CDT tests are listed below.

Math Grades 3-5 and Math Grades 6-HS

- Numbers \& Operations
- Algebraic Concepts
- Geometry
- Measurement, Data, and Probability

## Algebra I

- Operations with Real Numbers and Expressions
- Linear Equations \& Inequalities
- Functions \& Coordinate Geometry
- Data Analysis

Geometry

- Geometric Properties
- Congruence, Similarity, \& Proofs
- Coordinate Geometry \& Right Triangles
- Measurement

## Algebra II

- Operations with Complex Numbers
- Non-Linear Expressions \& Equations
- Functions
- Data Analysis

Reading Grades 3-5 and Reading/Lit Grades 6-HS

- Key Ideas and Details-Literature Text
- Key Ideas and Details-Informational Text
- Craft and Structure/Integration of Knowledge and Ideas-Literature Text
- Craft and Structure/Integration of Knowledge and Ideas-Informational Text
- Vocabulary Acquisition and Use

## Science Grades 3-5 and Science Grades 6-HS

- The Nature of Science
- Biological Sciences
- Physical Sciences
- Earth/Space Sciences

Biology

- Basic Biological Principles/Chemical Basis for Life
- Bioenergetics/Homeostasis \& Transport
- Cell Growth \& Reproduction/Genetics
- Theory of Evolution/Ecology

Chemistry

- Properties \& Classification of Matter
- Atomic Structure \& The Periodic Table
- The Mole \& Chemical Bonding
- Chemical Relationships \& Reactions

## Writing Grades 3-5 and Writing/Eng Comp Grades 6-HS

- Quality of Writing: Focus and Organization
- Quality of Writing: Content and Style
- Quality of Writing: Editing
- Conventions: Punctuation, Capitalization, and Spelling
- Conventions: Grammar and Sentence Formation

## NUMBER OF ITEMS PER DIAGNOSTIC CATEGORY

There were various factors considered when determining the number of operational items to administer per diagnostic category. The goal of the CDT is to provide diagnostic information. Therefore, the test must include a sufficient number of items to provide meaningful scores with low standard errors. However, testing time is limited and the item pools are finite. A very long test may produce lower standard errors, but if it is considered to be "too long" will teachers use it? Also, the longer the test, the more the items are exposed.

Prior to the launch of the first operational CDT in fall of 2010, simulations were run of various test lengths. Table 13-1 shows the average conditional standard error of measurement (CSEM) for total test and each diagnostic category ${ }^{1}$ (DC) for five test lengths in simulations of CDT Mathematics. Also included is the theoretical minimum standard error that is possible for each test length. This is the standard error if the ability is known and there are sufficient items to administer where the item's difficulty is equal to the known ability and the test constraints are met.

Table 13-1. Average Standard Errors for Various Test Lengths - Mathematics

| Total Number of Points | Total <br> Min <br> Error | Total <br> Avg <br> Error | Diagnostic Categories Number of Points | Diagnostic Categories Min Error | Diagnostic Categories DC1 Avg Error | Diagnostic Categories DC2 Avg Error | Diagnostic Categories DG3 Avg Error | Diagnostic Categories DC4 Avg Error | Diagnostic Categories DC5 Avg Error |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 40 | 0.316 | 0.348 | 8 | 0.707 | 0.789 | 0.796 | 0.784 | 0.783 | 0.798 |
| 45 | 0.298 | 0.329 | 9 | 0.667 | 0.738 | 0.741 | 0.729 | 0.734 | 0.742 |
| 50 | 0.283 | 0.313 | 10 | 0.632 | 0.690 | 0.707 | 0.691 | 0.691 | 0.696 |
| 55 | 0.270 | 0.298 | 11 | 0.603 | 0.660 | 0.667 | 0.655 | 0.653 | 0.659 |
| 60 | 0.258 | 0.286 | 12 | 0.577 | 0.633 | 0.636 | 0.622 | 0.622 | 0.631 |

As expected, increasing the number of items decreases the standard error. Differences in standard errors at the diagnostic category level for the same number of items are a reflection of differences in the diagnostic category item pools.

Figure 13-1 shows average standard errors as a function of test length.
Figure 13-1. Average Standard Errors for Various Test Lengths - Mathematics

[^16]Considering test time factors and simulation results for various test lengths, it was determined that CDT tests with four diagnostic categories would have 12-15 items per category (48-60 items total) and CDT tests with five diagnostic categories would have 10-12 items per category (50-60 items total).

## NUMBER OF EMBEDDED FIELD-TEST ITEMS

Over time, additional items will be needed to replenish the CDT item pools. Embedding field-test items within an operational CDT test is advantageous for two reasons. First, sufficient item level data can be gathered without the time and expense of a separate stand-alone administration. Second, it allows the new items to be placed on the existing operational scale. See Chapter Twelve for details.

As detailed in Chapter Six, there have been five embedded field-test events. Starting on February 14, 2013, field-test items were embedded within CDT Mathematics and Reading/Literature tests. Starting on August 26, 2013, items were embedded within CDT Mathematics, Reading/Literature, Science, and Writing/English Composition tests for students in grade 6. Starting on August 24, 2015, items were embedded within seven of the thirteen CDTs: Math Grades 6-HS, Algebra I, Reading Grades 3-5, Reading/Lit Grades 6-HS, Science Grades 6HS, Biology, and Writing/Eng Comp Grades 6-HS. Starting on August 20, 2018, items were embedded within all thirteen of the CDTs. Starting on August 19, 2019, items were embedded within all CDTs in the science content area except Chemistry.

For each embedded field-test event, the factors considered when determining the number of field-test items to embed included the number of items to be field tested, the expected number of students testing, and the desired n-count per item for field-test analyses. In mathematics, science, and writing, field-test items were randomly assigned to fixed positions spread throughout the operational test. In reading, a field-test passage was randomly assigned near the middle of the test and students took all of the items associated with the passage. In all content areas, the positions of field-test items were unknown to students. Field-test items were not clustered at the end of the test in an effort to avoid any fatigue effect when placing the items on the operational scale.

## CAT ALGORITHM

This section covers elements of the CAT algorithm including entry point, item selection criteria, test navigation, and termination.

## ENTRY POINT

All CDT tests other than Reading Grades 3-5 and Reading/Lit Grades 6-HS begin with a small "locator" section in which one or two items per diagnostic category are administered. The order of the diagnostic categories is random. The two CDT tests in the reading content area are slightly different because they are passage-based. Those, too, have a small "locator" section, but they may not contain one or two items for each diagnostic category because not all passages have an item for each diagnostic category.

The CAT algorithm is designed to administer items targeted for the individual student based on performance. However, student performance in the current test setting is not known at the beginning of the test. With no prior information about a student, the starting point in each diagnostic category is an item of average difficulty. For CDT tests that are not course-specific (Math Grades 3-5, Math Grades 6-HS, Reading Grades 3-5, Reading/Lit Grades 6-HS, Science Grades 3-5, Science Grades 6-HS, Writing Grades 3-5, and Writing/Eng Comp Grades 6-HS), the student's grade is considered in selecting an item of average difficulty. For example, a grade 7 student taking CDT Math Grades 6-HS will start with an item near the average difficulty of grade 7 items in the pool. For CDT tests that are course-specific (Algebra I, Geometry, Algebra II, Biology, and Chemistry), an average item will be selected regardless of the student's grade. For example, a grade 7 student taking CDT Algebra I will start with an item near the average difficulty of Algebra I items in the pool.

If a student has previously taken the CDT, the prior CDT scores are used to give the CAT algorithm a "head start." In this case, the first item in each diagnostic category is selected to match the characteristics of the prior information rather than an average item. For example, if a student previously took the CDT Math Grades 6-HS test and scored very high in "Measurement, Data, and Probability," then the first item selected in that diagnostic category will be more difficult than the grade level average.

The CAT algorithm includes a randomization component when selecting items to control item exposure. That is, one item is selected from among a set of items that are near the targeted item difficulty. This is especially important at the beginning of the CDT when no prior information is available. Randomization of items and diagnostic categories ensure that students will not see the same set of items in the same order even when all of the students are assigned items of average difficulty.

## ITEM SELECTION CRITERIA

Once the initial set of items has been administered, the CAT algorithm is designed to administer items targeted for the individual student based on performance. In targeting items, the CAT algorithm uses Rasch ability estimates from the current test session and considers a number of factors including test blueprint, response probability, item pool refinement, and passage-related concerns. Each of these is discussed in detail on the following pages.

## RASCH ABILITY ESTIMATES

As described in Chapter Eight and Chapter Nine, CDT item pools are scaled using the Rasch partial credit model (Wright \& Masters, 1982) and vertically linked across grades and courses. The CAT algorithm has access to all item parameters in the item pool. After each item response, Rasch ability estimates and standard errors are calculated via maximum likelihood estimation (MLE) for the total test and each diagnostic category. In the case of zero (all items incorrect) and perfect (all items correct) scores, a correction factor is applied before computing the relevant maximum likelihood estimates. A fractional value is added to a zero score and subtracted from a perfect score before estimation.

After the locator section of the CDT, but before a student has taken many items in each diagnostic category, the total Rasch ability estimate is used in item selection. This is because total and diagnostic category ability estimates tend to be highly correlated, and the total estimate does not change as dramatically as diagnostic category estimates given one additional item. Using the total estimate at this point prevents students from experiencing extreme fluctuations in the difficulty of items.

While use of the total Rasch ability estimate makes sense early in the test, the goal of the CDT is to be diagnostic, and some students exhibit clear strengths and areas of need in different diagnostic categories. Therefore, after four or five items have been administered in a diagnostic category, the corresponding Rasch ability estimate for that diagnostic category is used in item selection. This ensures, for example, that a student struggling in "Biological Sciences" while at the same time excelling in "Earth and Space Sciences" will be administered easier "Biological Sciences" items and more challenging "Earth and Space Sciences" items.

## TEST BLUEPRINT

The CAT algorithm closely resembles a modified constrained CAT (MCCAT) design (Leung, Chang, \& Hau, 2003). The general idea is that the CAT algorithm is configured with upper and lower bounds that specify the minimum and maximum numbers of items that will be administered to students for both total and diagnostic categories.

## RESPONSE PROBABILITY

No matter which Rasch ability estimate is used in selecting an item, total or diagnostic category estimate, the CAT algorithm targets items where the student has response probability (RP) of answering correctly, based on the Rasch ability estimate and item's difficulty. The most efficient way to run a CAT is to select items where RP is 0.5 . That is, select items where the student has a $50 \%$ chance of getting the item correct. This response probability produces the smallest standard error for any given number of items.

Prior to the launch of the first operational CDT in fall of 2010, simulations were run for various response probabilities. Table 13-2 shows the average person standard errors for total test and each diagnostic category ${ }^{2}$ for seven response probabilities in simulations of CDT Mathematics with 50 items. Figure 13-2 shows average standard errors as a function of response probability.

[^17]Table 13-2. Average Standard Errors for Various Response Probabilities - Mathematics

| Number of ltems | Response Probability | Total | DC 1 | DC 2 | DC 3 | DC 4 | DC 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 50 total (10 per DC) | 0.50 | 0.312 | 0.696 | 0.700 | 0.689 | 0.689 | 0.696 |
| 50 total (10 per DC) | 0.55 | 0.315 | 0.702 | 0.705 | 0.690 | 0.693 | 0.703 |
| 50 total (10 per DC) | 0.60 | 0.318 | 0.709 | 0.715 | 0.699 | 0.699 | 0.708 |
| 50 total (10 per DC) | 0.65 | 0.323 | 0.722 | 0.714 | 0.716 | 0.715 | 0.719 |
| 50 total (10 per DC) | 0.70 | 0.333 | 0.748 | 0.738 | 0.735 | 0.736 | 0.752 |
| 50 total (10 per DC) | 0.75 | 0.344 | 0.776 | 0.775 | 0.756 | 0.767 | 0.774 |
| 50 total (10 per DC) | 0.80 | 0.360 | 0.829 | 0.813 | 0.809 | 0.807 | 0.815 |

As expected, increasing the response probability increases the standard error. Differences in standard errors at the diagnostic category level for the same response probability are a reflection of differences in the diagnostic category item pools.

Figure 13-2. Average Standard Errors for Various Response Probabilities - Mathematics

As can be seen in Figure 13-2, increasing response probability incrementally from 0.50 leads to increases in standard error. The increase in standard error is gradual at first and becomes more pronounced around 0.65.

Prior to the launch of the CDT for students in grades 3 through 5 , the topic of response probability was revisited for each content area. Simulations for various response probabilities were run with fixed length tests equal to average test length. Results for each content area are presented in Tables 13-3 through 13-6 and Figures 13-3 through 13-6.

Table 13-3. Average Standard Errors for Various Response Probabilities - Mathematics

| Number of Items | Response <br> Probability | Total | DC 1 | DC 2 | DC 3 | DC 4 |
| :--- | ---: | :--- | :--- | :--- | :--- | :--- |
| 52 total (13 per DC) | 0.50 | 0.300 | 0.602 | 0.592 | 0.601 | 0.606 |
| 52 total (13 per DC) | 0.55 | 0.300 | 0.602 | 0.594 | 0.602 | 0.607 |

Figure 13-6. Average Standard Errors for Various Response Probabilities - Writing

Again, increasing response probability incrementally from 0.50 leads to increases in standard error. The increase in standard error is gradual at first and becomes more pronounced around 0.65.

For CDT tests designed for students in grade 6 and above, the response probability is set at 0.5 . This is based on the desire for low standard errors at the diagnostic category level and the grade level of students testing. As part of the CDT training, students are told that the test is computer adaptive and designed to challenge them.

For CDT tests designed for students in grades 3 through 5 , the response probability is set at 0.65 . This response probability results in higher standard errors for the same number of items. However, there was concern that younger students may not have much experience with tests designed to be so challenging and could conceivably give up on a test that is perceived to be "too hard."

## ITEM POOL REFINEMENT

The CAT algorithm has configurable elements that allow for refinement of the item pool used in item selection. The two configurable elements are:

- Restrict pool-The ability to restrict the available item pool by grade/course at various points in the test.

For example, Chemistry items are not available for the first 20 items of CDT Science Grades 6-HS test.

- Favor items-The ability to favor items that are close to the student's grade when evaluating items near a student's estimated score.

For example, if a student is in grade 8 and the item selection routine finds appropriate items (in terms of difficulty) in grades $4,5,6,7$, and 8 , item selection can favor items at or close to grade 8 . It is possible that no items near a student's grade are appropriate in terms of difficulty. In such a case, the CAT algorithm will select items further away from the student's grade but appropriate based on item difficulty.

The difference between restricting the pool and favoring items is that when the pool is restricted, some items may NOT be selected. With favoring, all non-restricted items are eligible for administration, but they are made more or less LIKELY to be selected based on closeness to student grade.

## PASSAGE RELATED CONCERNS

As previously mentioned, the CDT tests in the reading content area are passage-based. CDT passages have between one and seven associated items. The CAT algorithm does not require that all items associated with a passage be administered. Instead, it evaluates all possible combinations of items within a passage. Item sequencing within a passage is preserved when items are presented to the student. For example, if a six-item passage is selected and items 1 and 4 are NOT administered, then the items administered in order will be $2,3,5$, and 6.

The configurable elements of passage-based CAT include:

- Passage minimum percent-Define the minimum percentage of the items associated with a passage to be used.

For example, if the passage minimum percent is set at 80 , then the selection routine will consider combinations such as 1 of 1 (100\%), 4 of 5 ( $80 \%$ ), 5 of 6 ( $83 \%$ ), and 6 of 6 ( $100 \%$ ). It will not consider combinations such as 1 of $2(50 \%)$, 3 of $4(75 \%), 3$ of $5(60 \%)$, etc. Near the end of a test, the passage minimum percent constraint may need to be loosened in order to meet content constraints such as number of items per diagnostic category.

- Passage evaluation criteria-Multiple factors are considered when evaluating and ranking each passage combination to determine the best combination to administer to a student. They include:
- Percent of items associated with the passage used; the higher the percent, the higher the combination is ranked
- Number of items associated with the passage used; the higher the number, the higher the combination is ranked
- Distance between items' difficulties and student's estimated score; the smaller the distance, the higher the combination is ranked
- Distance between the items' grade levels and the student's grade level; the smaller the distance, the higher the combination is ranked
Different weights may be assigned to each of the factors. For example, if all of the weight is put on number of items used, then the algorithm will select the passages with the most associated items and administer all of them until the maximum number of items is reached.

## TEST NAVIGATION

Many versions of computer adaptive tests do not allow students to skip items in the test or back up to previously answered items and change answers due to some complicating factors.

If students are allowed to skip items, the CAT algorithm would need to select additional items without any additional information (no change to Rasch ability estimates). Taken to the extreme, a student with no prior CDT scores who skipped every item starting with the first would receive an entire test of average items. It would not be adaptive at all.

If students are allowed to back up and change answers, Rasch ability estimates are re-calculated when answered are changed. This additional information can be used to select additional items but would not change previously selected items. For example, suppose a student is on item twenty-five and goes back to change the answer to item eleven from wrong to right. The total and corresponding diagnostic category Rasch ability estimates would go up. That additional information can be used in selection of items twenty-six and beyond. However, items twelve through twenty-five are not reselected even though different items may have been selected if item eleven was initially answered correctly. When it comes to items twelve through twentyfive, "the train has left the station."

Also, if students are allowed to back up in the test, additional considerations must be put in place to ensure that the answer to one item does not cue another.

Currently all CDT tests except Reading Grades 3-5 and Reading/Lit Grades 6-HS do not allow skipping items or backing up and changing answers. On CDT tests in the reading content area, students are allowed to skip items within a passage. For example, when presented with a passage and five associated items, the student does not have to answer questions one through five in that order without skipping. If a student tries to navigate to the next passage without answering all of the items associated with a passage, the test engine will prompt the student to answer all items and will not move on to the next passage until all are answered.

## TERMINATION

The CAT algorithm allows for both a fixed- or variable-length test.
With fixed length, the test ends when a student has taken a predefined number of items total and in each diagnostic category.

With variable length, the algorithm stops administering items from a diagnostic category when one of two conditions is satisfied:

- A student has taken at least a predefined minimum number of items in that diagnostic category and the standard error is below a predefined threshold OR
- A student has taken a predefined maximum number of items in that diagnostic category The test ends when one of the two conditions above is satisfied for each of the diagnostic categories.

Note that with both fixed- and variable-length tests, there is no requirement that the predefined number of items in diagnostic categories be equal.

## CAT CONFIGURATION - MATH GRADES 6-HS

The test has four diagnostic categories. Each student will take between 12 and 15 operational items per diagnostic category for a total test of 48 to 60 operational items. With no prior information about a student, the starting point in each diagnostic category will be an item of average difficulty by grade level. For example, a grade 7 student will start with an item near the average difficulty of grade 7 items. Items are selected where the response probability is 0.5 , meaning a student has a $50 \%$ chance of answering correctly. The CAT algorithm will stop administering items in a diagnostic category when one of two conditions is satisfied:

- a student has taken at least 12 operational items in that diagnostic category and the standard error is below 0.60 , or
- a student has taken 15 operational items in that diagnostic category.

Functionality is used to restrict the pool and to favor items close to a student's grade. The pool restrictions are:

- no Algebra I items will be administered in the first 5 items,
- no Geometry items will be administered in the first 10 items, and
- no Algebra II items will be administered in the first 20 items.

Simulations were run with this configuration. On average:

- a total of 53 operational items are administered-about 13 per diagnostic category,
- standard error for the total score is 0.30 , and
- standard errors for the diagnostic categories are in the range of 0.59 to 0.62 .

## DIAGNOSTIC CATEGORY TESTS

Starting on January 28, 2019, CDTs were available that allowed students to take a single one of the four diagnostic categories associated with Math Grades 6-HS. Given that the content is limited to a single diagnostic category, the number of items is increased from 12 to 15 per diagnostic category to 15 to 18 . This allows for more precise estimates (lower standard error) than the full test in which all diagnostic categories are tested.

## CAT CONFIGURATION - ALGEBRA I

The test has four diagnostic categories. Each student will take between 12 and 15 operational items per diagnostic category for a total test of 48 to 60 operational items. With no prior information about a student, the starting point in each diagnostic category will be an item of average difficulty. Items are selected where the response probability is 0.5 , meaning a student has a $50 \%$ chance of answering correctly. The CAT algorithm will stop administering items in a diagnostic category when one of two conditions is satisfied:

- a student has taken at least 12 operational items in that diagnostic category and the standard error is below 0.60 , or
- a student has taken 15 operational items in that diagnostic category.

Functionality is used to restrict the pool and to favor items close to Algebra I. The pool restriction is that no Algebra Il items will be administered in the first 16 items.

Simulations were run with this configuration. On average:

- a total of 53 operational items are administered-about 13 per diagnostic category,
- standard error for the total score is 0.30 , and
- standard errors for the diagnostic categories are in the range of 0.60 to 0.61 .

## DIAGNOSTIC CATEGORY TESTS

Starting on January 28, 2019, CDTs were available that allowed students to take a single one of the four diagnostic categories associated with Algebra I. Given that the content is limited to a single diagnostic category, the number of items is increased from 12 to 15 per diagnostic category to 15 to 18. This allows for more precise estimates (lower standard error) than the full test in which all diagnostic categories are tested.

## CAT CONFIGURATION - GEOMETRY

The test has four diagnostic categories. Each student will take between 12 and 15 operational items per diagnostic category for a total test of 48 to 60 operational items. With no prior information about a student, the starting point in each diagnostic category will be an item of average difficulty. Items are selected where the response probability is 0.5 , meaning a student has a $50 \%$ chance of answering correctly. The CAT algorithm will stop administering items in a diagnostic category when one of two conditions is satisfied:

- a student has taken at least 12 operational items in that diagnostic category and the standard error is below 0.60 , or
- a student has taken 15 operational items in that diagnostic category.

Functionality is used to favor items close to Geometry. There are no pool restrictions.
Simulations were run with this configuration. On average:

- a total of 53 operational items are administered-about 13 per diagnostic category,
- standard error for the total score is 0.30 , and
- $\quad$ standard errors for the diagnostic categories are in the range of 0.60 to 0.61 .

## DIAGNOSTIC CATEGORY TESTS

Starting on January 28, 2019, CDTs were available that allowed students to take a single one of the four diagnostic categories associated with Geometry. Given that the content is limited to a single diagnostic category, the number of items is increased from 12 to 15 per diagnostic category to 15 to 18 . This allows for more precise estimates (lower standard error) than the full test in which all diagnostic categories are tested.

## CAT CONFIGURATION - ALGEBRA II

The test has four diagnostic categories. Each student will take between 12 and 15 operational items per diagnostic category for a total test of 48 to 60 operational items. With no prior information about a student, the starting point in each diagnostic category will be an item of average difficulty. Items are selected where the response probability is 0.5 , meaning a student has a $50 \%$ chance of answering correctly. The CAT algorithm will stop administering items in a diagnostic category when one of two conditions is satisfied:

- a student has taken at least 12 operational items in that diagnostic category and the standard error is below 0.60 , or
- a student has taken 15 operational items in that diagnostic category.

Functionality is used to favor items close to Algebra II. There are no pool restrictions.
Simulations were run with this configuration. On average:

- a total of 53 operational items are administered-about 13 per diagnostic category,
- standard error for the total score is 0.30 , and
- $\quad$ standard errors for the diagnostic categories are in the range of 0.60 to 0.67 .

## DIAGNOSTIC CATEGORY TESTS

Starting on January 28, 2019, CDTs were available that allowed students to take a single one of the four diagnostic categories associated with Algebra II. Given that the content is limited to a single diagnostic category, the number of items is increased from 12 to 15 per diagnostic category to 15 to 18 . This allows for more precise estimates (lower standard error) than the full test in which all diagnostic categories are tested.

## CAT CONFIGURATION - MATH GRADES 3-5

The test has four diagnostic categories. Each student will take between 12 and 15 operational items per diagnostic category for a total test of 48 to 60 operational items. With no prior information about a student, the starting point in each diagnostic category will be an item of average difficulty by grade level. For example, a grade 4 student will start with an item near the average difficulty of grade 4 items. Items are selected where the response probability is 0.65 , meaning a student has a $65 \%$ chance of answering correctly. The CAT algorithm will stop administering items in a diagnostic category when one of two conditions is satisfied:

- a student has taken at least 12 operational items in that diagnostic category and the standard error is below 0.62, or
- a student has taken 15 operational items in that diagnostic category.

Functionality is used to restrict the pool and to favor items close to a student's grade. The pool restrictions are:

- no grade 7 items will be administered in the first 5 items,
- no grade 8 items will be administered in the first 10 items,
- no Algebra I items will be administered in the first 20 items, and
- no Geometry or Algebra II items will be administered.

Simulations were run with this configuration. On average:

- a total of 52 operational items are administered-about 13 per diagnostic category,
- $\quad$ standard error for the total score is 0.31 , and
- $\quad$ standard errors for the diagnostic categories are in the range of 0.61 to 0.62 .

## DIAGNOSTIC CATEGORY TESTS

Starting on January 28, 2019, CDTs were available that allowed students to take a single one of the four diagnostic categories associated with Math Grades 3-5. Given that the content is limited to a single diagnostic category, the number of items is increased from 12 to 15 per diagnostic category to 15 to 18 . This allows for more precise estimates (lower standard error) than the full test in which all diagnostic categories are tested.

## CAT CONFIGURATION - READING/LIT GRADES 6-HS

The test has five diagnostic categories. Each student will take between 10 and 12 operational items per diagnostic category for a total test of 50 to 60 operational items. With no prior information about a student, the starting point in each diagnostic category will be an item of average difficulty by grade level. For example, a grade 7 student will start with an item near the average difficulty of grade 7 items. Items are selected where the response probability is 0.5 , meaning a student has a $50 \%$ chance of answering correctly. The CAT algorithm will stop administering items in a diagnostic category when one of two conditions is satisfied:

- a student has taken at least 10 operational items in that diagnostic category and the standard error is below 0.75 , or
- a student has taken 12 operational items in that diagnostic category.

Functionality is used to run CAT with passages and favor items close to student's grade. There are no pool restrictions.

Passage minimum percent is set at 66\%. That is, whenever possible, only passage combinations that use 66\% or more of the associated items are used. (Near the end of a test, the passage minimum percent constraint may need to be loosened in order to meet content constraints.) Many simulations were run to arrive at this percent. On the one hand, testing time and reading load should be minimized. Therefore, students should not have to read long passages for only one or two items. On the other hand, using all items associated with a passage may not be desirable since some items are far from a student's estimated score. Given a limited number of items, those that are either too easy or too hard should not be used.

In evaluating and ranking passages, percent of items associated with the passage is not used. Simulation results indicate that if it is factored into evaluations, students take many short passages because 1 of 1 (100\%) and 2 of 2 $(100 \%)$ are ranked higher than 5 of $6(83 \%)$ and 4 of $5(80 \%)$, for example.

Simulations were run with this configuration. On average:

- a total of 56 operational items are administered-about 11 per diagnostic category,
- a total of 14 passages are administered,
- standard error for the total score is 0.30 , and
- standard errors for the diagnostic categories are in the range of 0.72 to 0.82 .

## DIAGNOSTIC CATEGORY TESTS

Diagnostic category tests in the reading content area are different than the other content areas because items are passage-based. Testing a single diagnostic category would result in students reading full passages for only one or two items. Instead, diagnostic category tests associated with Reading/Literature Grades 6-HS are separated by text type - literature text or informational text. Each of the two tests have three diagnostic categories ${ }^{3}$. Students take between 10 and 12 operational items per diagnostic category for a total test of 30 to 36 operational items. Diagnostic category tests were first available on January 28, 2019.

## CAT CONFIGURATION - READING GRADES 3-5

The test has five diagnostic categories. Each student will take between 10 and 12 operational items per diagnostic category for a total test of 50 to 60 operational items. With no prior information about a student, the starting point in each diagnostic category will be an item of average difficulty by grade level. For example, a grade 4 student will start with an item near the average difficulty of grade 4 items. Items are selected where the response probability is 0.65 , meaning a student has a $65 \%$ chance of answering correctly. The CAT algorithm will stop administering items in a diagnostic category when one of two conditions is satisfied:

- a student has taken at least 10 operational items in that diagnostic category and the standard error is below 0.77 , or
- a student has taken 12 operational items in that diagnostic category.

Functionality is used to run CAT with passages and favor items close to student's grade. The pool is restricted so that students will not receive passages associated with a grade that is more than four grades above the student's grade.

[^18]Passage minimum percent is set at 66\%. That is, whenever possible, only passage combinations that use 66\% or more of the associated items are used. (Near the end of a test, the passage minimum percent constraint may need to be loosened in order to meet content constraints.) Many simulations were run to arrive at this percent. On the one hand, testing time and reading load should be minimized. Therefore, students should not have to read long passages for only one or two items. On the other hand, using all items associated with a passage may not be desirable since some items are far from a student's estimated score. Given a limited number of items, those that are either too easy or too hard should not be used.

In evaluating and ranking passages, percent of items associated with the passage is not used. Simulation results indicate that if it is factored into evaluations, students take many short passages because 1 of 1 (100\%) and 2 of 2 ( $100 \%$ ) are ranked higher than 5 of $6(83 \%)$ and 4 of $5(80 \%)$, for example.

Simulations were run with this configuration. On average:

- a total of 56 operational items are administered-about 11 per diagnostic category,
- a total of 14 passages are administered,
- standard error for the total score is 0.30 , and
- standard errors for the diagnostic categories are in the range of 0.73 to 0.78 .

Note that the standard error is higher for in reading than the other content areas. This is because Reading/Lit Grades 6-HS and Reading Grades 3-5 are passage-based. Rather than selecting one targeted item at a time, the item selection routine evaluates and selects multiple items associated with a given passage. In general, items selected in this manner are not as close to the targeted response probability as stand-alone items selected one by one.

## DIAGNOSTIC CATEGORY TESTS

Diagnostic category tests in the reading content area are different than the other content areas because items are passage-based. Testing a single diagnostic category would result in students reading full passages for only one or two items. Instead, diagnostic category tests associated with Reading/Literature Grades 6-HS are separated by text type - literature text or informational text. Each of the two tests have three diagnostic categories ${ }^{4}$. Students take between 10 and 12 operational items per diagnostic category for a total test of 30 to 36 operational items. Diagnostic category tests were first available on January 28, 2019.

## CAT CONFIGURATION - SCIENCE GRADES 6-HS

The test has four diagnostic categories. Each student will take between 12 and 15 operational items per diagnostic category for a total test of 48 to 60 operational items. With no prior information about a student, the starting point in each diagnostic category will be an item of average difficulty by grade level. For example, a grade 7 student will start with an item near the average difficulty of grade 7 items. Items are selected where the response probability is 0.5 , meaning a student has a $50 \%$ chance of answering correctly. The CAT algorithm will stop administering items in a diagnostic category when one of two conditions is satisfied:

- a student has taken at least 12 operational items in that diagnostic category and the standard error is below 0.60 , or
- a student has taken 15 operational items in that diagnostic category.

Functionality is used to restrict the pool and to favor items close to a student's grade. The pool restrictions are:

- no grade 11 items will be administered in the first 20 items UNLESS the student is in grade 11 or 12,
- no Biology or Chemistry items will be administered in the first 20 items.

[^19]Simulations were run with this configuration. On average:

- a total of 52 operational items are administered-about 13 per diagnostic category,
- standard error for the total score is 0.30 , and
- $\quad$ standard errors for the diagnostic categories are in the range of 0.60 to 0.62 .

## DIAGNOSTIC CATEGORY TESTS

Starting on January 28, 2019, CDTs were available that allowed students to take a single one of the four diagnostic categories associated with Science Grades 6-HS. Given that the content is limited to a single diagnostic category, the number of items is increased from 12 to 15 per diagnostic category to 15 to 18 . This allows for more precise estimates (lower standard error) than the full test in which all diagnostic categories are tested.

## CAT CONFIGURATION - BIOLOGY

The test has four diagnostic categories. Each student will take between 12 and 15 operational items per diagnostic category for a total test of 48 to 60 operational items. With no prior information about a student, the starting point in each diagnostic category will be an item of average difficulty. Items are selected where the response probability is 0.5 , meaning a student has a $50 \%$ chance of answering correctly. The CAT algorithm will stop administering items in a diagnostic category when one of two conditions is satisfied:

- a student has taken at least 12 operational items in that diagnostic category and the standard error is below 0.60, or
- a student has taken 15 operational items in that diagnostic category.

Functionality is used to favor items close to Biology. There are no pool restrictions.
Simulations were run with this configuration. On average:

- a total of 52 operational items are administered-about 13 per diagnostic category,
- standard error for the total score is 0.30 , and
- $\quad$ standard errors for the diagnostic categories are in the range of 0.60 to 0.61 .

## DIAGNOSTIC CATEGORY TESTS

Starting on January 28, 2019, CDTs were available that allowed students to take a single one of the four diagnostic categories associated with Biology. Given that the content is limited to a single diagnostic category, the number of items is increased from 12 to 15 per diagnostic category to 15 to 18 . This allows for more precise estimates (lower standard error) than the full test in which all diagnostic categories are tested.

## CAT CONFIGURATION - CHEMISTRY

The test has four diagnostic categories. Each student will take between 12 and 15 operational items per diagnostic category for a total test of 48 to 60 operational items. With no prior information about a student, the starting point in each diagnostic category will be an item of average difficulty. Items are selected where the response probability is 0.5 , meaning a student has a $50 \%$ chance of answering correctly. The CAT algorithm will stop administering items in a diagnostic category when one of two conditions is satisfied:

- a student has taken at least 12 operational items in that diagnostic category and the standard error is below 0.60 , or
- a student has taken 15 operational items in that diagnostic category.

Functionality is used to favor items close to Chemistry. There are no pool restrictions.

Simulations were run with this configuration. On average:

- a total of 53 operational items are administered-about 13 per diagnostic category,
- standard error for the total score is 0.30 , and
- $\quad$ standard errors for the diagnostic categories are in the range of 0.60 to 0.64 .

## DIAGNOSTIC CATEGORY TESTS

Starting on January 28, 2019, CDTs were available that allowed students to take a single one of the four diagnostic categories associated with Chemistry. Given that the content is limited to a single diagnostic category, the number of items is increased from 12 to 15 per diagnostic category to 15 to 18. This allows for more precise estimates (lower standard error) than the full test in which all diagnostic categories are tested.

## CAT CONFIGURATION - SCIENCE GRADES 3-5

The test has four diagnostic categories. Each student will take between 12 and 15 operational items per diagnostic category for a total test of 48 to 60 operational items. With no prior information about a student, the starting point in each diagnostic category will be an item of average difficulty by grade level. For example, a grade 4 student will start with an item near the average difficulty of grade 4 items. Items are selected where the response probability is 0.65 , meaning a student has a $65 \%$ chance of answering correctly. The CAT algorithm will stop administering items in a diagnostic category when one of two conditions is satisfied:

- a student has taken at least 12 operational items in that diagnostic category and the standard error is below 0.62 , or
- a student has taken 15 operational items in that diagnostic category.

Functionality is used to restrict the pool and to favor items close to a student's grade. The pool restrictions are:

- no grade 11 items will be administered in the first 40 items, and
- no Biology or Chemistry items will be administered.

Simulations were run with this configuration. On average:

- a total of 52 operational items are administered-about 13 per diagnostic category,
- standard error for the total score is 0.31 , and
- $\quad$ standard errors for the diagnostic categories are in the range of 0.61 to 0.62 .

## DIAGNOSTIC CATEGORY TESTS

Starting on January 28, 2019, CDTs were available that allowed students to take a single one of the four diagnostic categories associated with Science Grades 3-5. Given that the content is limited to a single diagnostic category, the number of items is increased from 12 to 15 per diagnostic category to 15 to 18 . This allows for more precise estimates (lower standard error) than the full test in which all diagnostic categories are tested.

## CAT CONFIGURATION - WRITING/ENG COMP GRADES 6-HS

The test has five diagnostic categories. Each student will take between 10 and 12 operational items per diagnostic category for a total test of 50 to 60 operational items. With no prior information about a student, the starting point in each diagnostic category will be an item of average difficulty by grade level. For example, a grade 7 student will start with an item near the average difficulty of grade 7 items. Items are selected where the response probability is 0.5 , meaning a student has a $50 \%$ chance of answering correctly. The CAT algorithm will stop administering items in a diagnostic category when one of two conditions is satisfied:

- a student has taken at least 10 operational items in that diagnostic category and the standard error is below 0.65 , or
- a student has taken 12 operational items in that diagnostic category.

Functionality is used to favor items close to the student's grade. There are no pool restrictions.

Simulations were run with this configuration. On average:

- a total of 56 operational items are administered-about 11 per diagnostic category,
- standard error for the total score is 0.29 , and
- $\quad$ standard errors for the diagnostic categories are in the range of 0.65 to 0.70 .

## DIAGNOSTIC CATEGORY TESTS

Starting on January 28, 2019, CDTs were available that allowed students to take a single one of the five diagnostic categories associated with Writing/English Composition Grades 6-HS. Given that the content is limited to a single diagnostic category, the number of items is increased from 10 to 12 per diagnostic category to 15 to 18. This allows for more precise estimates (lower standard error) than the full test in which all diagnostic categories are tested.

## CAT CONFIGURATION - WRITING GRADES 3-5

The test has five diagnostic categories. Each student will take between 10 and 12 operational items per diagnostic category for a total test of 50 to 60 operational items. With no prior information about a student, the starting point in each diagnostic category will be an item of average difficulty by grade level. For example, a grade 4 student will start with an item near the average difficulty of grade 4 items. Items are selected where the response probability is 0.65 , meaning a student has a $65 \%$ chance of answering correctly. The CAT algorithm will stop administering items in a diagnostic category when one of two conditions is satisfied:

- a student has taken at least 10 operational items in that diagnostic category and the standard error is below 0.67 , or
- a student has taken 12 operational items in that diagnostic category.

Functionality is used to favor items close to the student's grade. There are no pool restrictions.
Simulations were run with this configuration. On average:

- a total of 56 operational items are administered-about 11 per diagnostic category,
- standard error for the total score is 0.30 , and
- $\quad$ standard errors for the diagnostic categories are in the range of 0.67 to 0.70 .

## DIAGNOSTIC CATEGORY TESTS

Starting on January 28, 2019, CDTs were available that allowed students to take a single one of the five diagnostic categories associated with Writing Grades 3-5. Given that the content is limited to a single diagnostic category, the number of items is increased from 10 to 12 per diagnostic category to 15 to 18 . This allows for more precise estimates (lower standard error) than the full test in which all diagnostic categories are tested.

Tables 13-7 through 13-12 summarize CAT configurations by content area.

## CHAPTER FOURTEEN: SCORES AND SCORE REPORTS

Teachers will receive immediate and usable data to be used for targeting instruction to meet the needs of individual students. The CDT interactive reporting provides direct links to resources in SAS, including specific lesson plans, interventions, and other resources. The reports can also show the progress of students across test administrations. This overview summarizes the steps in accessing the interactive reports, as well as the types of information available for each type of report.

## ACCESSING INTERACTIVE REPORTS

Any user with the role of District, School, or Teacher has the ability to view the interactive reports. Once the user is logged in, Report Delivery can be selected under MY APPLICATIONS, at the top of the screen. Next, the user selects CDT Interactive Reports. The user is presented information on the Dashboard, prior to accessing the reports. Once a report is selected, the user will begin to make selections within the available pre-filters to generate the report on the page, once the Go button is clicked.

The pre-filters include: District, School, Teacher, Student Group, Content Area, Assessment, Diagnostic Category, Map Configuration, Date Range. The filters are smart filters. This means the filter will pre-populate based on the data the user has access to or based on the previous filter selections made.

## GROUP MAP

The Interactive Reports use colors to indicate relative Strengths to Build On and Areas of Need. Each descriptor correlates with a color range on the scale: Green/Blue = Strengths to Build On; Red = Areas of Need.

- Each gray dot on the Group Map represents a single student score.
- Only students within the Student Group, with scores, will have a gray dot appear on the map.
- All dots represent the assessment score(s) during the administration window, identified using the Date Range filter.
- The Group Map is intended to provide general assessment information based on a group of student scores within a full CDT assessment and/or Diagnostic Category CDT.
- The Diagnostic Category maps, found below the Group Map, provide all scores associated with the Diagnostic Categories tested within the full assessment, as well as for all individual Diagnostic Category CDT assessments completed. The scores are represented with yellow plotted dots.

Initially, the Group Map shows the entire vertical scale (representing scores from 200 to 2000 for Lower Grades Mathematics, Lower Grades Reading, Lower Grades Science, and Lower Grades Writing; representing scores from 400 to 2000 for Mathematics, Algebra I, Algebra II, Geometry, Reading/Literature, Science, Biology, Chemistry, and Writing/English Composition). The Scale Score filter provides the user the ability to narrow the reported set of students down to those falling in similar ranges, from the selected Student Group.

Diagnostic Category Maps - These maps appear below the Group Map or will appear as the Group Map, if a single Diagnostic Category is selected in the filters.

Hover Over-A pop-up of the Name, PAsecureID, Test Date, and Score shows whenever an educator hovers over a gray dot representing a student score.

Grid View - This appears below the map(s) and provides a complete list of the students within the selected Student Group as well as additional information, including the date of the test events, each students score for each diagnostic category, and overall scores.

## INDIVIDUAL MAP

The Individual Map has the ability to show the all assessments that apply to the Map Configuration and Date Range selected for an individual student. The Individual Map is intended to provide general Instructional Enrichment (a set of Eligible Content) based on a student's score within a Diagnostic Category.

Student Filter - The Student drop-down menu can be used to select a student to show the Individual map. When a new student is selected, the map will refresh.

Diagnostic Categories - These appear below each of the columns at the bottom of the map.
Hover Over-A pop-up of the Assessment Date and Score shows when an educator hovers over the dot in the middle of the reported data point.

Eligible Content and Sample Items - This appears in a table below the Individual Map, providing the list of Eligible Content Codes the student would benefit from having additional instruction, as well as links to Sample Items to show what an item may look like when tested.

Grid View - This appears below the Eligible Content Code and Sample Item table and provides a complete list of the student's test scores and performance details. This includes the following: overall scale score, individual diagnostic category scores, Standard Error of Measurement (SEM), achieved color band within the map.

## GROUP AND INDIVIDUAL LEARNING PROGRESSION MAP

The Group and Individual Learning Progression Map is a graphical representation about how learning may typically move toward increased understanding over time based on Eligible Content. Each row represents the Eligible Content in a subject's domain and subdomain and for a specific grade level or course. The column of the grade/ course is highlighted based on the Map Configuration that has been selected.

- A green dot indicates that the student was presented with at least one test item for the Eligible Content and performed as well or better than the expected performance of a student who is considered just ready for the next grade/course.
- A red dot indicates that the student was presented with at least one test item from the Eligible Content and the student's performance was less than the expected performance of a student who is considered just ready for the next grade/course.
- An empty box represents Eligible Content that is available, but the student was not presented with any test items from that Eligible Content.

The Learning Progression Summary table shows the performance of students in the group that received one or more items for the listed Eligible Content Code.

- Number of Students shows the count of students that tested the identified Eligible Content.
- Total Count of Green shows the number of students in the student group who were administered one or more items for a given Eligible Content and received a green dot.
- Total Count of Red shows the number of students in the student group who were administered one or more items for a given Eligible Content and received a red dot.
- Number of Items indicates the total number of items tested by students associated with the listed Eligible Content.
- Points Possible indicates total points possible based on the items tested for the listed Eligible Content.

The Item Grade Level Summary table shows the items by grade-level by ECC for all students selected.
The Learning Progression table shows the number of points earned and points possible by Eligible Content within the tested Diagnostic Category for each individual student within the group selected or for the individual student selected.

## GROUP LEARNING PROGRESSION MAP

The Growth and Focus Report automatically generates reports aimed at comparing test sessions for students by identifying a change in scale score and grouping students into focus groups. The information is intended to help teachers further modify instruction for those students not making progress or to further support those students excelling in the content area.

## CHAPTER FIFTEEN: OPERATIONAL ADMINISTRATION 2019-2020

This chapter contains summary information about the operational administration of the Classroom Diagnostic Tools (CDT) during the 2019-2020 school year. Two types of CDTs were available-full CDTs and diagnostic category CDTs. Full CDTs test four or five diagnostic categories in one test session. Diagnostic category CDTs focus on a single diagnostic category in math, science and writing, or a single text type with three diagnostic categories in reading. Results in this chapter focus on full CDTs except where specifically noted. Also, this chapter focuses on CDTs completed from the start of the school year (August 19, 2019) through the school closures as a result of Covid-19 (March 13, 2020). Some additional CDTs were completed in different settings following school closures. Counts of these can be found in Appendix J.

## FREQUENCIES

Tables 15-1 through 15-3 present information related to the number of students who were administered one or more CDT tests in the 2019-2020 school year. Tables 15-1a and 15-1b show the number of students who have taken each CDT. Some of these students have taken the same CDT test multiple times or have taken multiple CDT tests. Table 15-1 counts only the first administration of each CDT test. Data about multiple administrations of the same test and multiple CDT tests are presented in Tables 15-2 and 15-3, respectively.

Table 15-1a. Number of Students Taking the First Administration of a Full CDT by Grade Level

| CDT | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | TOTAL |

Further demographic information about students tested with the CDT is found in the next section.

## DEMOGRAPHIC CHARACTERISTICS

## COMPOSITION OF SAMPLE USED IN SUBSEQUENT TABLES

To avoid double counting of students, the following demographic tables are based on students' first administration for a given CDT test. Students taking only diagnostic category tests are counted with the parent test ${ }^{1}$. For example, a student taking Math Grades 3-5 Numbers and Operations is counted under Math Grades 3-5. Students who took the same test multiple times are counted only once. Students who took different tests are counted for each test. For example, if a student took CDT Algebra I twice, he or she is counted only once in the Algebra I counts; if a student took Algebra I once and Biology once, he or she is counted in both Algebra I and Biology counts.

## COLLECTION OF STUDENT DEMOGRAPHIC INFORMATION

Data for analyses of demographic characteristics were obtained primarily from information supplied by school district personnel through the Pennsylvania Information Management System (PIMS) and subsequently transmitted to DRC. However, teachers may assign CDT tests to students who do not have data in PIMS at the time of testing. This may result in CDT records with incomplete demographic information.

## DEMOGRAPHIC CHARACTERISTICS

Frequency data for various demographic categories are presented in Tables 15-4 through 15-16. Shown at the bottom of the appropriate table is the number of students with a total test score on which the column percentages are based. Percentages in some categories may sum to a quantity below 100 percent due to missing data.

Analyses are broken out by grade level. However, in the case of course-specific CDT tests (Algebra I, Geometry, Algebra II, Biology, and Chemistry), students across multiple grades may be enrolled in the course.

Caution should be used in interpreting CDT demographic data, since participation is voluntary and complete demographic data via PIMS is not required for testing. This is especially true for rows in the lower half of the tables (e.g. IEP, Migrant, and Economically Disadvantaged) because these typically have more than ninety-five percent blank responses.

[^20]Table 15-4. Demographic Characteristics of Students Taking CDT Math Grades 3-5

## SUMMARY STATISTICS—TEST LENGTH

The analyses from here until the section titled "Multiple Administrations of the Same CDT Test" include all records in the full CDT operational assessments completed before school closures on March 13, 2020. When a student took CDT Math Grades 6-HS twice, for example, both records were used in the analyses.

As noted in Chapter Thirteen, full CDT tests have either four or five diagnostic categories. On tests with five diagnostic categories (Reading Grades 3-5, Reading/Lit Grades 6-HS, Writing Grades 3-5, and Writing/Eng Comp Grades 6-HS), students take between 10 and 12 operational items per diagnostic category for a total test of 50 to 60 operational items. On tests with four diagnostic categories (Math Grades 3-5, Math Grades 6-HS, Algebra I, Geometry, Algebra II, Science Grades 3-5, Science Grades 6-HS, Biology, and Chemistry), students take between 12 and 15 operational items per diagnostic category for a total test of 48 to 60 operational items.

Tables 15-17a and 15-17b show the summary statistics for the test length for each assessment. Summary statistics are based on the number of items presented to the student and include minimum, maximum, quartiles 1 and 3 , mean, and median.

Table 15-17a. Summary Statistics for Full CDT Test Length (Number of Operational Items Administered)

| CDT | $N$ | Minimum | Q1 | Median | Mean | Q3 | Maximum |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

The minimum number of items was quite similar, ranging from 48 to 50 . The mean and median were higher for tests in the reading and writing content areas, which have five diagnostic categories. The maximum number of items administered was fixed at 60 for all CDT tests.

All diagnostic category CDTs in the math, science and writing content areas focus on a single diagnostic category. Tests range from 15 to 18 items. Diagnostic category CDTs in the reading content area focus on a single text type with three diagnostic categories. Tests range from 30 to 36 items.

## SUMMARY STATISTICS—SCALE SCORES AND CONDITIONAL STANDARD ERRORS

Tables 15-18a and 15-18b show the summary statistics for the scale scores. Tests with multiple benchmark cuts are broken down to match the grade level of the cuts. Tests that are course-specific are not broken down.

Table 15-18a. Summary Statistics for Scale Score Based on Full CDT

Tables 15-19a and 15-19b show the summary statistics for the conditional standard errors of measurement (CSEMs) in the scale score metric. The final column in the table shows the theoretical minimum CSEM that is possible for a test length equal to the mean number of points. This is the standard error if the student's ability is known and there are sufficient items in the operational pool to administer where the item's difficulty is equal to the known ability and the test constraints are met.

Values in the "Minimum" column that are less than the "Theoretical Minimum" are due to students taking more than the mean number of points. Recall that calculation of "Theoretical Minimum" is based on the mean number of points.

Figures 15-1 through 15-8 show the scale score distributions for the total test for the content areas mathematics, reading, science, and writing. Tests with multiple benchmark cuts are broken down to match the grade level of the cuts while tests that are course-specific are not broken down. The benchmark cuts in place during the 2019-2020 school year are shown in green ${ }^{2}$. The bottom plot in each figure represents the distribution of items in the content area pools.

## SUMMARY STATISTICS - SCALE SCORES AND CONDITIONAL STANDARD ERRORS FOR DIAGNOSTIC CATEGORY SUB-SCORES FROM FULL CDT

Earlier in this chapter, tables 15-18b and 15-19b show summary statistics for the diagnostic category scale scores and conditional standard errors from diagnostic category CDT tests. In this section, tables Table 15-20 and Table 15-21 show summary statistics for diagnostic categories from full CDT tests. Diagnostic category sub-scores from full CDTs are presented here because N-counts are significantly higher. For example, there are only 69 tests of Geometry Geometric Properties while there are 6,879 tests of Geometry which includes the sub-score Geometric Properties. To be consistent with previous tables, tests with multiple benchmark cuts are broken down to match the grade level of the cuts, while tests that are course-specific are not broken down.

Table 15-20. Summary Statistics for Diagnostic Category Scale Score Based on Full CDT

| CDT | Diagnostic Category | $N$ | Minimum | Q1 | Median | Mean | Q3 | Maximum |

Table 15-21 shows the summary statistics for the conditional standard errors of measurement (CSEMs) for diagnostic categories in the scale score metric based on full CDT. The final column in the table shows the theoretical minimum CSEM that is possible for a test length equal to the mean number of points. Minimum values in the table that are less than the theoretical minimum are due to students taking more than the mean number of points.

## DIAGNOSTIC CATEGORY SCORE DIFFERENCES

As described in Chapter Fourteen, the CDT reports that are available to teachers display scale scores and probable score ranges for each diagnostic category. The probable score range is the scale score $\pm$ one standard error. Probable score range differences-ranges that do not overlap-may indicate to teachers a meaningful difference between two diagnostic category scores. Tables 15-22a through 15-34a show the number of students with score range differences (non-overlapping probable score ranges) between pairs of diagnostic categories for each full ${ }^{3}$ CDT test. For example, according to Table 15-22a, 28,274 students who took the Math Grades 3-5 assessment had score range differences between diagnostic categories 1 and 2 while 105,375 students did not. Tables 15-22b through 15-34b show the total number of score range differences. For example, 24,820 students had two pairs of diagnostic categories with score range differences, which was $18.6 \%$ of the total students who took Math Grades 3-5.

Table 15-22a. Diagnostic Category Score Range Differences - Math Grades 3-5

| Group 1 | Group 2 | Yes |  | No |  |
| :--- | :--- | ---: | ---: | ---: | ---: |

Significant differences among diagnostic categories were tested based on t-test. Using the diagnostic category scale scores and the conditional standard errors for each student, the differences between pairs of diagnostic category scores were examined based on t-test for each student. A Bonferroni correction for multiple comparisons was performed to keep the familywise Type I error rate at 0.32 . This results in the number of significant differences being smaller than the number of score range differences (non-overlapping probable score ranges) presented above. Tables 15-35a through 15-47a show the number of students who had significant differences between pairs of diagnostic categories for each assessment. Tables 15-35b through 15-47b show the total number of significant differences.

Low numbers of significant differences across diagnostic categories, along with the high disattenuated correlations between categories and exploratory factor analyses discussed in Chapter Seventeen, suggest that some diagnostic categories might be measuring essentially the same construct. While this may be the case in general, when looking at group summary information, diagnostic category scores for individual students can provide useful information to teachers. For example, while 81.3\% of students showed no significant differences between Algebra I diagnostic categories, $18.7 \%$ of students did. CDT diagnostic category scores for these students along with links to instructional resources are a valuable tool for teachers.

The tables in Appendix D show the significant differences with the familywise Type I error rate at 0.10.

## DISTRIBUTION OF BENCHMARK RANGES

As described in Chapter Ten, committees of Pennsylvania educators established preliminary CDT cut scores for grade 5 and above prior to the first operational use. Following the 2010-2011 school year, the preliminary cut scores were revised for the mathematics content-area tests. See Chapter Nineteen of the 2010-2011 technical report for details. Following the 2011-2012 school year, the preliminary cut scores were revised for the reading, science, and writing content-area tests. See Chapter Nineteen of the 2011-2012 technical report for details. Cut points for grades 2 through 4 were interpolated from existing cuts in grade 5 and above prior to the first operational use of CDT tests for grades 3 through 5 . See Chapter Nineteen of the 2013-2014 technical report for details. Following the 2014-2015 school year, the cut scores were revised for the mathematics, reading, and writing content-area tests based on the revised PSSA tests. See Chapter Nineteen of the 2015-2016 technical report for details.

The benchmark cuts in place during the 2019-2020 school year determine the color ranges (red/green/blue) in the CDT dynamic reporting suite. The cut scores and standard errors (SE) ${ }^{4}$ were used to define ranges as follows: The green range is defined as the scale score cut $\pm$ one SE. The red range is defined as the scale minimum ( 200 for all CDTs except Algebra I, Geometry, Algebra II, Biology, and Chemistry which are 400) to the lower bound of the green range. The blue range is defined as the upper bound of the green range to the scale maximum (2000).

Table 15-48 shows the number and percentage of students in each benchmark range for each full CDT test. Tests with multiple benchmark cuts are broken down to match the grade level of the cuts. Tests that are course-specific are not broken down. All results are based on the cut points in place for the 2019-2020 school year.

[^23]Table 15-48. Number and Percent of Students in Each CDT Score Range

## MULTIPLE ADMINISTRATIONS OF THE SAME CDT TEST

As previously indicated, there are a number of students who took the same full CDT test multiple times. This section focuses on the number of days between administrations and both changes in scale score and benchmark range across a student's first and last administrations.

Table 15-49 shows the summary statistics for the number of days from the first to last administration.

Table 15-49. Summary Statistics for Number of Days between Administrations

| CDT | $N$ | Minimum | Q1 | Median | Mean | Q3 | Maximum |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## CHAPTER SIXTEEN: RELIABILITY

This chapter addresses the reliability of Classroom Diagnostic Tools (CDT) test scores. According to the Standards for Educational and Psychological Testing (AERA, APA, \& NCME, 2014), the general notion of reliability/precision refers to
the consistency of scores across replications of a testing procedure, regardless of how this consistency is estimated or reported (p.33).

Frisbie (2005) highlighted several elements of reliability. First, reliability is a property of test scores, not of a test itself. Many may appreciate this distinction, but in casual usage, individuals frequently make reference to a "reliable test." While reliability concerns test scores (and not the test specifically), it's important to appreciate the fact that test scores can be affected by characteristics of the instrument. For example, all other things being equal, tests with more items/points tend to be more reliable than tests with fewer items/points. Second, reliability coefficients are group specific. Reliabilities tend to be higher in populations that are more heterogeneous and lower in populations that are more homogeneous. Consequently, both test length and population heterogeneity should be considered when evaluating reliability.

There are other reliability considerations that may be less evident from the Standards' definition yet are still important for test users to understand. While freedom from measurement error is very important, reliability is specifically concerned with random sources of error. Indeed, the degree of inconsistency due to random error sources is what determines reliability: less consistency is associated with lower reliability and more consistency is associated with higher reliability. Of course, systematic error sources also exist. These can artificially increase reliability and decrease validity. Validity is further discussed in Chapter Seventeen.

Another noteworthy issue is that multiple sources of error exist (e.g., the day of testing, the items used). However, most widely used reliability indices only reflect a single type of error. Consequently, it is important for test users to understand what specific type of error is being considered in a reliability study, and equally, if not more importantly, what types are not.

Understanding the distinction between relative error and absolute error is also important, as many reliability indices only reflect relative error. Relative error is of interest whenever the relative ordering of individuals with respect to their test performance is of interest. Understanding examinee rank-order stability is important; however, such stability might be well achieved even when the specific score values are considerably different. When specific score values are considered important (e.g., if cut cores are used), then absolute error is of interest, too. Generally, there is more error variance when considering the absolute scores of examinees, which, in turn, suggests lower reliability.

As the above discussion suggests, reliability is a complex, nonunitary notion that cannot be adequately represented by a single number. There are several reliability indices available, and these may not provide the same results (Frisbie, 2005). The remainder of this chapter covers the following:

- Reliability coefficients and their interpretation
- Unconditional and conditional standard errors of measurement (SEMs and CSEMs)
- Decision consistency

## RELIABILITY INDICES

As shown below, the reliability coefficient expresses the consistency of test scores as the ratio of true score variance to total score variance. The total variance contains two components: 1) variance in true scores and 2 ) variance due to the imperfections in the measurement process. Put differently, total variance equals true score variance plus error variance. ${ }^{1}$

$$
\rho_{X}^{2}=\frac{\sigma_{T}^{2}}{\sigma_{X}^{2}}=\frac{\sigma_{T}^{2}}{\sigma_{T}^{2}+\sigma_{E}^{2}}
$$

[^24]Reliability coefficients indicate the degree to which differences in test scores reflect true differences in the attribute being tested rather than random fluctuations. Total test score variance (i.e., individual differences) is partly due to real differences in the attribute (true variance) and partly due to random error in the measurement process (error variance).

Reliability coefficients range from 0.0 to 1.0 . If all test score variance were true, the index would equal 1.0. The index would be 0.0 if none of the test score variance were true. Such scores would be pure random noise (i.e., all measurement error). If the index had a value of 1.0 , scores would be perfectly consistent (i.e., contain no measurement error). Although values of 1.0 are never achieved in practice, it is clear that larger coefficients are more desirable, as they indicate that test scores are less influenced by random error. "How big is big enough?" and "how small is too small?" are issues considered in a later section.

As noted in the introduction, there are several different indices that can be used to estimate this ratio. One approach is referred to as internal consistency, which is derived from analyzing the performance consistency of individuals over the items within a test. As discussed below, these internal consistency indices do not take into account other sources of error, such as day-to-day variations (student health, testing environment, etc.).

## COEFFICIENT ALPHA

Although a number of reliability indices exist, one of the most frequently reported for achievement tests is coefficient alpha. For example, both PSSA and Keystone programs report alpha.

## FORMULA FOR ALPHA

Consider the following data matrix representing the scores of persons (rows) on items (columns):
Table 16-1. Person $\times$ Item Score (Xpi) Infinite (Population-Universe) Matrix

| Person | Item 1 | Item 2 | $\ldots$ | Item $\boldsymbol{i}$ | $\ldots$ | Item $\boldsymbol{k}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Person 1 | $Y 11$ | $Y 12$ | $\ldots$ | $Y 1 i$ | $\ldots$ | $X 1 k$ |
| Person 2 | $Y 21$ | $Y 22$ | $\ldots$ | $Y 2 i$ | $\ldots$ | $X 2 k$ |
| $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ |
| Person $p$ | $Y p 1$ | $Y p 2$ | $\ldots$ | $Y p i$ | $\ldots$ | $X p k$ |
| $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ |
| Person $N$ | $Y N 1$ | $Y N 2$ | $\ldots$ | $Y N i$ | $\ldots$ | $X N k$ |

Note: Adapted from Cronbach and Shavelson (2004).
Then, a general computational formula for alpha is as follows:

$$
\alpha=\frac{N}{N-1}\left(1-\frac{\sum_{i=1}^{N} \sigma_{Y i}^{2}}{\sigma_{X}^{2}}\right),
$$

where $N$ is the number of parts (items or testlets), $\sigma_{X}^{2}$ is the variance of the observed total test scores, and $\sigma_{Y i}^{2}$ is the variance of part $i$.

Examination of the formula for alpha indicates why the coefficient is not appropriate for CDT. In the case of CDT, tests are adaptive. Each student takes a unique set of test items rather than the same fixed form. A person item score matrix for CDT analogous to Table 16-1 would include all items in the available item pool (over 5,000 in some cases). Each student takes only a small subset of items (48-60) from the available pool. Summing the variance of more than 5,000 item scores and dividing by the variance of test scores based on $48-60$ items is not appropriate. Therefore, a measure of reliability other than alpha must be used for CDT.

## SPLIT-HALF RELIABILITY

Like alpha, split-half is an internal consistency index. It can be conceptualized as the extent to which an exchangeable set of items from the same domain would result in a similar rank ordering of students. Note that relative error is reflected in this index. Variation in student performance from one sample of items to the next should be of particular concern for any test user. Consider two hypothetical vocabulary tests intended for the same group of students. Each test contains different sets of unique words that are believed to be randomly equivalent, perhaps like the ones shown below:

Table 16-2. Two Hypothetical Vocabulary Tests

| Test One | Test Two |
| :--- | :--- |
| Abase | Abate |
| Boon | Bilk |
| Capricious | Circuitous |
| Deface | Debase |
| $\cdots$ | $\cdots$ |
| Zealous | Zenith |

If a representative group of students could take both of these tests, the correlation between the scores obtained would represent the parallel forms reliability of the test scores. However, such data-collection designs are impractical in large-scale settings and experimental confounds like fatigue and practice effects are likely to affect the results. Internal-consistency reliability indices arose in part to provide reliability measures using the data from just a single test administration. So, if students only took Test One and the split-half reliability index for those test scores was high, this would suggest that Test Two would provide a very similar rank ordering of the students if they had taken it instead. If split-half reliability was low, dissimilar rank orderings would likely be observed-again, relative-error variance is reflected.

## CALCULATION OF SPLIT-HALF RELIABILITY

To determine split-half reliability for a given CDT test, such as Biology, each administration of the test was split into two halves. Each item's difficulty was considered in the split so the halves represent approximately equivalent alternative forms. Rasch ability estimates were then calculated for each of the two halves. Then, Pearson correlation was computed between the Rasch ability estimates from the two halves. Finally, the Pearson correlation was adjusted for test length using the Spearman-Brown prediction formula as described below.

Split-Half reliability $=\frac{2 r}{1+r} \quad$ where $r=$ Pearson correlation
Split-half reliability is related to coefficient alpha in that alpha is often interpreted as the mean of all possible split-half coefficients.

## FURTHER INTERPRETATIONS

What reliability value is considered high enough? What values are considered too low? Although frequently asked for, any rules of thumb for interpreting the magnitude of reliability indices are mostly arbitrary. One approach is to research the reliabilities from similar testing instruments to see what values are commonly observed. For $2019^{2}$ PSSA tests in Mathematics, English Language Arts (ELA), and Science, reliability coefficients ranged from 0.85 to 0.92. For spring 2019 Keystone exams in Algebra I, Literature, and Biology, reliability coefficients were 0.93, 0.93, and 0.92 , respectively. For many other state assessment programs, reliabilities in the low 0.90 s are usually the highest observed, and reliabilities in the high 0.80 s are very common.

The lower a given reliability coefficient, the greater the potential for over-interpretation of the associated results. As suggested earlier, there is no firm guideline regarding how low is too low. However, as an informative point of

[^25]reference, a reliability coefficient of 0.50 would mean that there is as much error variance as true-score variance in the scores.

## DIAGNOSTIC CATEGORY SCORE RELIABILITY

As noted in the introduction, reliabilities tend to be higher with an increase in test length and lower with a decrease in test length. Figure 16-1 illustrates this relationship for a hypothetical 45 -item test with three total score reliabilities: $0.95,0.90$, and 0.85 . As an example, the curve for reliability equal to 0.90 suggests that a 10 -item diagnostic category score would be expected to have a score reliability of just over 0.65 . The use of the SpearmanBrown prediction formula assumes all items are exchangeable, which, in practice, they may not be. While such a chart may not perfectly model actual diagnostic category reliability, the intent is to illustrate the substantial impact that limited numbers of items can have on diagnostic category score reliability.

Figure 16-1. Example of the Relationship between Test Length and Reliability Reliability Curves

## STANDARD ERROR OF MEASUREMENT

The reliability coefficient is a unit-free indicator that reflects the degree to which scores are free of measurement error. It always ranges between 0.0 and 1.0 regardless of the test's scale. Reliability coefficients best reflect the extent to which measurement inconsistencies may be present or absent in a group. However, they are not that useful for helping users interpret test scores. The standard error of measurement (SEM) is another indicator of test score precision that is better suited for determining the effect of measurement inconsistencies on the scores obtained by individual examinees. This is particularly so for conditional SEMs (CSEM) discussed further below.

## TRADITIONAL STANDARD ERROR OF MEASUREMENT

A precise, theoretical interpretation of the SEM is somewhat unwieldy. A beginning point for understanding the concept is as follows. If everyone being tested had the same true score, ${ }^{3}$ there would still be some variation in observed scores due to imperfections in the measurement process, such as random differences in attention during instruction or concentration during testing, the sampling of test items, etc. The standard error is defined as the standard deviation ${ }^{4}$ of the distribution of observed scores for students with identical true scores. Because the SEM is an index of the random variability in test scores in actual score units, it represents very important information for test score users.

[^26]The SEM formula is provided below:

$$
\text { SEM }=S D \sqrt{1-\text { reliability }}
$$

It indicates that the value of the SEM depends on both the reliability coefficient and the standard deviation of test scores. If the reliability were equal to 0.00 (the lowest possible value), the SEM would be equal to the standard deviation of the test scores. If test reliability were equal to 1.00 (the highest possible value), the SEM would be 0.0. In other words, a perfectly reliable test has no measurement error (Harvill, 1991). Additionally, the value of the SEM takes the group variation (i.e., score standard deviation) into account.

## TRADITIONAL SEM CONFIDENCE INTERVALS

The SEM is an index of the random variability in test scores in actual score units, which is why it has such great utility for test score users. SEMs allow statements regarding the precision of individual tests scores. SEMs help place reasonable limits (Gulliksen, 1950) around observed scores through construction of an approximate score band. Often referred to as confidence intervals, these bands are constructed by taking the observed scores, X , and adding and subtracting a multiplicative factor of the SEM. As an example, students with a given true score will have observed scores that fall between $\pm 1$ SEM about two-thirds of the time. ${ }^{5}$ For $\pm 2$ SEM confidence intervals, the percentage increases to about 95 percent.

## FURTHER INTERPRETATIONS

## ONE SEM FOR ALL TEST SCORES

The SEM approach described above only provides a single numerical estimate for constructing the confidence intervals for examinees regardless of their score levels. In reality, however, such confidence intervals vary according to one's score. Consequently, care should be taken when using the SEM for students with extreme scores. An alternate approach is described in the next section that conditions the SEM on a student's score estimate.

## GROUP SPECIFIC

As noted in the introduction, reliabilities are group specific. The same is true for SEMs because both score reliabilities and score standard deviations vary across groups.

## SCALE SCORE METRIC

The SEM approach is calculated using scale scores, and as such, the resulting confidence interval bands are in the scale score metric.

## TYPE OF ERROR REFLECTED

The interpretation of the SEM should be driven by the type of score reliability that underpins it. So, the CDT SEMs involve the same source of error relevant to internal consistency indices. As noted earlier, a precise technical explanation of the SEM (and resulting confidence intervals) can be unwieldy. Because of this, score users are often provided less complex interpretations.

One simpler description sometimes used is that a confidence interval represents the possible score range that one would observe if a student could be tested twice with the same instrument. Taking the same test on a different day implies the only source of random error being considered is related to the occasion of testing-such as a student might be sleepier one day than another, might be sick, or might not have eaten a good breakfast. There is a reliability index that captures this source of random error and it is referred to as the test-retest reliability coefficient. This is not the type of reliability computed for the CDT. When internal consistency reliability estimates are used, such an explanation blurs the fact that random error based on the occasion of testing is not considered.

[^27]When SEMs are derived from internal consistency reliability estimates, a better approach is to describe the confidence interval as providing reasonable bounds for the range of scores that a student might receive if he or she took an equivalent version of the test. That is, the student took a test that covered exactly the same content, but included a different set of items. As an example, if the Algebra I score was 1078 and the SEM band was 1038 to 1118 , then a student would be likely to receive a score somewhere between 1038 and 1118 if he or she took a different version of the test without additional instruction.

## RESULTS AND OBSERVATIONS

Split-half reliability coefficients and associated (traditional) SEMs for CDT tests are presented in Table 16-3. Values were derived using the operational data from the 2019-2020 school year. The results are presented for total scores and each diagnostic category score. The statistics reported include number of students tested ( $N$ ), mean scale score, standard deviation of scale score, split-half reliability, and traditional standard error of measurement (SEM) in the scale score metric.

Table 16-3. CDT Reliabilities

| CDT | Score | Average Number of Points | $N$ | Scale <br> Score <br> Mean | $\begin{array}{r} \text { Scale } \\ \text { Score SD } \end{array}$ | Split-Half Reliability | SEM in <br> Scale <br> Score <br> Metric |

The overall test score reliability values are high and similar to those reported for PSSA and Keystone Exams. The reliabilities at the diagnostic category level are lower due to the fact that each diagnostic category contains fewer items.

## RASCH CONDITIONAL STANDARD ERRORS OF MEASUREMENT

The CSEM also indicates the degree of measurement error in scale score units, but varies as a function of a student's actual scale score. Therefore, the CSEM may be especially useful in characterizing measurement precision in the neighborhood of a score level used for decision-making-such as cut scores for identifying students who meet a performance standard.

Technically, when a Rasch model is applied, the CSEM at any given point on the ability continuum is defined as the reciprocal of the square root of the test information function derived from the Rasch scaling model:

$$
\operatorname{CSEM}\left(\hat{\beta}_{n}\right)=\frac{1}{\sqrt{l\left(\hat{\beta}_{n}\right)}}
$$

where $\operatorname{CSEM}\left(\hat{\beta}_{n}\right)$ is the conditional standard error of measurement and $I\left(\hat{\beta}_{n}\right)$ is the test information function. Test information depends on the sum of the corresponding information functions for the test items. Item information depends on each item's difficulty and conditional item score variance. The formula above utilizes the Rasch ability $\left(\hat{\beta}_{n}\right)$ metric. The conditional standard error on the scale score (SS) metric is determined simply by multiplying the $\operatorname{CSEM}\left(\hat{\beta}_{n}\right)$ by the slope (multiplicative constant, $m$ ) of the linear transformation equation used to convert the Rasch ability estimates to scale scores:

$$
\operatorname{CSEM}(\mathrm{SS})=\operatorname{CSEM}\left(\hat{\beta}_{n}\right)^{\star} m
$$

Chapter Eleven provides the linear transformation formulas for each of the CDT content areas.

## RASCH CSEM CONFIDENCE INTERVALS

CSEMs also allow statements regarding the precision of individual tests scores. And like SEMs, they help place reasonable limits around observed scale scores through construction of an approximate score band. The confidence intervals are constructed by adding and subtracting a multiplicative factor of the CSEM and may be interpreted as described in the earlier section.

## FURTHER INTERPRETATIONS

## DIFFERENT CSEMS FOR DIFFERENT TEST SCORES

The CSEM approach provides different numerical estimates for constructing the confidence intervals for examinees depending on their specific score. On fixed form tests, the magnitude of the CSEM values is often "U" shaped, with larger CSEM values associated with lower and higher scores. With a fixed set of items, there is less information for students scoring at the extremes, and CSEM is inversely related to the information function (the more information, the lower the CSEM). Given that CDT tests are adaptive, this "U" shape tends to be less pronounced as students are presented with items targeted at their level. While there is some " $U$ " shape at the extreme ends of the vertical scale, there is a much larger area on the scale where CSEMs are relatively flat compared to fixed form tests. The adaptive tests allow for greater information and, therefore, lower CSEMs across a wide range of the vertical scale.

## GROUP SPECIFIC

Assuming reasonable model-data fit-as explored in Chapter Eight-the Rasch based CSEMs (conditioned on score level) should not vary across groups.

## SCALE SCORE METRIC

The CSEM and associated confidence interval bands are in the scale score metric.

## TYPE OF ERROR REFLECTED

The CSEMs reported in the dynamic reporting suite are the Rasch-based conditional standard errors of measurement described above. Score report content is considered in greater detail in Chapter Fourteen.

## RESULTS AND OBSERVATIONS

Figures 16-2 through 16-14 show the average Rasch CSEMs associated with various scale score ranges based on operational data from the 2019-2020 school year. The values are fairly consistent across a large range of scores on the vertical scale. The values increase at the low and high ends of the scale score range.

Figure 16-6. Average Conditional Standard Errors for Algebra II

Figure 16-7. Average Conditional Standard Errors for Reading Grades 3-5

Figure 16-8. Average Conditional Standard Errors for Reading/Lit Grades 6-HS

CSEMs tend to be higher in the reading content area. This is due to the fact that CDT Reading Grades 3-5 and CDT Reading/Lit Grades 6-HS are passage-based. The items from a selected passage may not be as closely targeted to the student's level as when individual items are selected one at a time. For more information on adaptive selection of passages, see Chapter Thirteen.

## DECISION CONSISTENCY

Classification decision consistency refers to the degree to which the achievement level for each student can be replicated upon retesting using an equivalent form (Huynh, 1976). While CDT is designed to be administered multiple times in the school year to gauge progress following instruction, retesting in the context of decision consistency refers to retesting shortly after testing without additional instruction.

In a standards-based testing program, there should be great interest in knowing how accurately students are classified into performance categories. In contrast to reliability, which is concerned with the relative rank-ordering of students, it is the absolute values of student scores that are important in decision consistency.

Decision consistency answers the question "What is the agreement between the classifications based on two nonoverlapping, equally difficult forms of the test?" If two parallel forms of the test were given to the same students (without additional instruction), the consistency of the measure would be reflected by the extent to which the classification decisions made based on the first set of test scores matched the decisions based on the second set of test scores. Consider Table 16-4:

Table 16-4. Pseudo-Decision Table for Three Hypothetical Categories

| Test Level | Test One - Level I | Test One - Level II |  | Test One - Level III | Test One - Marginal |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Test Two - Level I | $\varphi_{11}$ | $\varphi_{12}$ | $\varphi_{13}$ | $\varphi_{1} \bullet$ |  |
| Test Two - Level II | $\varphi_{21}$ | $\varphi_{22}$ | $\varphi_{23}$ | $\varphi_{2 \bullet}$ |  |
| Test Two - Level III | $\varphi_{31}$ | $\varphi_{32}$ | $\varphi_{33}$ | $\varphi_{3 \bullet}$ |  |
| Test Two - Marginal | $\varphi_{\bullet 1}$ | $\varphi_{\bullet 2}$ | $\varphi_{\bullet 3}$ | 1 |  |

If a student is classified as in one category based on Test One's score, how probable would it be that the student would be reclassified in the same category if he or she took Test Two (a non-overlapping, equally difficult form of the test)?

The proportions of correct decisions, $\varphi$, for three categories is computed as:

$$
\tilde{O}=\varphi 11+\varphi 22+\varphi 33
$$

It is the sum of the diagonal entries - that is, the proportion of students classified by the two forms into exactly the same level-that would signify the overall consistency.

Since it is not feasible to repeat CDT tests one right after the other with no additional instruction in order to estimate the proportion of students who would be reclassified in the same performance levels, a statistical model needs to be imposed on the data in order to project the consistency of classifications solely using data from the available administration (Hambleton and Novick, 1973). Two well-known methods were developed by Hanson and Brennan (1990) and Livingston and Lewis (1995) utilizing specific true score models. While both measures are reported for PSSA and Keystone Exams, the statistical models imposed on the data depend upon a beta binomial distribution of raw scores. Given that the CDT is adaptive (i.e., raw scores using a response probability of 0.5 are generally equal to one-half of test length), these measures are not reported for CDT. Instead, decision consistency measures in this section are a Rasch-based index that relies on conditional standard errors (CSEMs). Also reported are results based on simulations and kappa.

The decision consistency measures reported in the section are based on the Rasch model and conditional standard errors (Stearns and Smith, 2007). Each person's scale score has an associated conditional standard error. Each of the performance levels on the test has an established benchmark cut in the scale score metric. Given these three pieces of information, the assumption of a normal distribution of measurement error allows one to calculate the probability that a student would receive the same classification on retesting. Using the statistic:

$$
z=\frac{S S_{n}-S S B C}{S E_{S S_{n}}}
$$

where $S S n$ is the scale score estimate for person $n, S S B C$ is the scale score benchmark cut, and $S E_{s S}$, is the asymptotic standard error of the person scale score estimate. Using cumulative normal probabilities, the probability that a retest would produce the same performance level classification and the probability of a different performance level classification were calculated. The process was repeated for each cut score which results in a probability of classification in each of the performance levels. The total classification rate for the entire sample is the average of the probabilities of the same classification on retesting.

Table 16-5 provides an example based on CDT Algebra I operational data from the 2019-2020 school year. Recall that in the dynamic reporting suite, scores are classified into one of three color ranges-red, green, or blue. The benchmark cut points used for the analyses are the cut points in place during the 2019-2020 school year.

Table 16-5. Retest Classification Probability - Algebra I

|  | Red - retest | Green - retest | Blue - retest |
| :--- | ---: | ---: | ---: |
| Red - test | 0.949 | 0.051 | 0.000 |
| Green - test | 0.174 | 0.799 | 0.027 |
| Blue - test | 0.000 | 0.197 | 0.803 |

Consider students with scores in the green range: The probability of scoring in the red range if retested is 0.174 . The probability of scoring in the green range again is 0.799 . The probability of scoring in the blue range is 0.027 .

The total classification rate is determined by taking the weighted average of the diagonal probabilities where the weights are the number of students in the corresponding range. There are 83,366 students in the sample: 68,919 with total scores in the red range, 13,647 in the green range, and 800 in the blue range. The total classification rate is $\left[(0.949)^{*}(68,919)+(0.799)^{*}(13,647)+(0.803)^{*}(800)\right] / 83,366=0.923$.

In addition to the exact agreement rate, Cohen's kappa ${ }^{6}$ was also calculated as 0.743 .
In cases with multiple categories, an alternative to kappa, which treats every misclassification as equally important, is a weighted kappa that considers differences that are non-adjacent as more "off." While relevant, given there are three categories, weighted kappa is the same as kappa in this case because both the red/blue and blue/red cells in Table 16-5 are zero.
$3 \times 3$ retest classification probability tables for all CDT tests and benchmark cuts comparable to Table 16-5 are presented in Appendix E.

Stearns and Smith (2007) point out that one advantage of this method is that each student can understand how likely it is that he or she would be classified in the same range if the student took the test over without additional instruction. In addition, each student can learn the probability with which he or she would be reclassified in any of the ranges. A student scoring right at the cut score will have a lower rate of consistent classification than a student scoring in the middle of a performance level band. This can be seen in Table 16-6, which is based on the same Algebra I data set and cut points and shows for various scale scores the percent chance of scoring in each color range if retested.

[^28]Table 16-6. Retest Classification Percent for Various Scale Score Ranges - Algebra I

| Scale Score Range | Number of <br> Students | Red <br> (\% Chance in <br> Category if <br> Retested*) | Creen <br> (\% Chance in <br> Category if <br> Retested*) | Blue <br> (\% Chance in <br> Category if <br> Retested*) | \% Chance in <br> Same Category <br> if Retested |
| :--- | ---: | ---: | ---: | ---: | ---: |
| 保 |  |  |  |  |  |

[^29]Tables for all CDT tests and benchmark cuts comparable to Table 16-6 are presented in Appendix E.
As previously mentioned, it is not feasible to repeat CDT tests one right after the other with no additional instruction in order to estimate decision consistency. However, simulations were run as a validation of the results based on the Stearns and Smith method. The reported Algebra I scores from 2019-2020 were used as true scores in order to simulate retest results. Table 16-7 repeats the Algebra I results from Table 16-5, shows the simulation results, and displays the differences.

Table 16-7. Compare Stearns and Smith Results to Simulation Retest Classification Probability - Algebra I

|  | Red - retest | Green - retest | Blue - retest |

## CHAPTER SEVENTEEN: VALIDITY

As defined in the Standards for Educational and Psychological Testing (AERA, APA, \& NCME, 2014), validity refers to "the degree to which evidence and theory support the interpretations of test scores for proposed uses of tests" (p. 11). The Standards provides a framework for describing the sources of evidence that should be considered when evaluating validity. These sources include evidence based on 1) test content, 2) response processes, 3) the internal structure of the test, 4) the relationships between test scores and other variables, and 5) the consequences of testing. In addition, when Item Response Theory (IRT) models are used to analyze assessment data, validity considerations related to those processes should also be explored.

The validity process involves the collection of a variety of evidence to support the proposed test score interpretations and uses. The entire technical report describes the technical aspects of the Classroom Diagnostic Tools (CDT) in support of its score interpretations and uses. Each of the previous chapters contributes important evidence components that pertain to score validation: test development, test administration, test scoring, item analysis, Rasch calibration, scaling, equating, score reporting, and reliability. This chapter is used to summarize and synthesize the evidence based on the framework of the Standards. The purposes and intended use of the CDT is reviewed first, and then each type of validity evidence is addressed in turn.

## PURPOSES AND INTENDED USES OF THE CDT

The Standards emphasize that validity pertains to how test scores are used. To help contextualize the evidence that will be presented below, the purposes of the CDT will be reviewed first. The CDT was developed to support teachers and students in grades 3 through 12. These tools, available at no cost to districts, are fully integrated and aligned in the Standards Aligned System (SAS) and enable educators to identify students' academic strengths and areas of need, as well as provide links to classroom resources. The assessment is administered completely online using a computer adaptive test (CAT) model, and participation is voluntary. CDT scores are available immediately after testing in the dynamic reporting suite. In addition to the scores, this suite includes links to instructional resources. The CDT may be used multiple times throughout the school year.

## EVIDENCE BASED ON TEST CONTENT

Test content validity evidence for the CDT rests greatly on establishing a link between each piece of the assessment (i.e., the items) and what students should know and be able to do as prescribed by the Assessment Anchors and Eligible Content. The CDT is intended to measure the knowledge and skills described in the Assessment Anchors and Eligible Content for grades 3 through 8 and high school in mathematics, reading, science, and writing, and courses Algebra I, Geometry, Algebra II, Literature, Biology, Chemistry, and English Composition.

Lane (1999) suggests taking the following steps to support the content validity of an assessment. In the case of the operational CDT, one should:

- evaluate the degree to which the test specifications represent and align with the knowledge and skills described in the corresponding Assessment Anchors and Eligible Content.
- evaluate the alignment between the CDT items and test specifications to ensure representativeness.
- evaluate the extent to which the curriculum aligns with the Assessment Anchors and Eligible Content.
- conduct content reviews of the CDT items using a panel of content experts to see whether items measure the intended construct or are the sources of construct-irrelevant variance.
- conduct fairness reviews of the items to avoid issues related to a specific subpopulation.
- evaluate procedures for administration and scoring such as the appropriateness of instructions to examinees, practice/training with online tools and tests, and time limits for the assessments.
- submit operational tests to third-party independent reviews.

Chapters Two through Five of this report present a considerable amount of evidence related to test content. As described in these chapters, all the items were developed and aligned with the Assessment Anchors and Eligible Content. After development and prior to field testing, items were reviewed for content and bias issues. After being field tested, items were reviewed with respect to their statistical properties and alignment with the learning progressions. Items selected for inclusion in the operational pools had to pass content, psychometric, and PDE reviews. Tests were administrated according to standardized procedures with allowable accommodations.

Some of the efforts made to ensure content validity are summarized below.

- DRC used Webb's (1999) Depth of Knowledge (DOK) model to ensure the CDT items aligned with the Assessment Anchors and Eligible Content and the Academic Content Standards in terms of both content and cognitive levels.
- DRC established detailed test and item/passage development specifications and ensured the items were sufficient in number and adequately distributed across content, levels of cognitive complexity, and levels of difficulty.
- DRC selected qualified item writers and provided training to help ensure they wrote high-quality items.
- All newly developed items were first reviewed by content specialists and editors at DRC to make sure they measured the intended Assessment Anchors and Eligible Content. Appropriateness for the intended students was also considered, as well as depth of knowledge, graphics, grammar/punctuation, language demand, and distractor reasonableness.
- Prior to field testing, the test items were submitted to content committees (composed of Pennsylvania educators) for review using, but not limited to, the following categories:
- Overall quality and clarity
- Anchor, Eligible Content, and/or standard alignment
- Grade-level appropriateness
- Difficulty level
- Depth of knowledge
- Appropriate sources of challenge (e.g., unintended content and skills)
- Correct answer
- Quality of distractors
- Graphics
- Appropriate language demand
- Freedom from bias
- The items were also submitted to a Bias, Fairness, and Sensitivity Committee for review. This committee reviewed items for issues related to diversity, gender, and other pertinent factors.
- Items passing all prior hurdles were tried out in a stand-alone or embedded field-test event. Several statistical analyses were conducted on the field-test data including classical item analyses, distractor analyses, and differential item functioning (DIF) analyses. Items were again carefully reviewed by DRC staff and a committee of Pennsylvania teachers with respect to their statistical characteristics. DIF was used to detect test items that might bias test scores for particular groups. Empirical investigation of DIF strengthens the validity evidence related to score interpretations for students in particular groups by eliminating potential sources of construct-irrelevant variance.
- Following field testing, the items were submitted to content committees (composed of Pennsylvania educators) for review and alignment with the learning progressions.
- The CDT was administered according to standardized procedures with allowable accommodations. Students were given ample time to complete the tests (i.e., there were no speediness issues).

## EVIDENCE BASED ON RESPONSE PROCESS

Response-process evidence is used to examine the extent to which the cognitive skills and processes employed by students match those identified in the test developer's defined construct domains for all students and for each subgroup. Think-aloud procedures or "cognitive labs" can be used to collect this type of evidence.

For the operational 2019-2020 CDT, no cognitive lab studies were conducted to collect the response process evidence.

## EVIDENCE BASED ON INTERNAL STRUCTURE

As described in the Standards (2014), internal-structure evidence refers to the degree to which the relationships among test items and test components conform to the construct on which the proposed test interpretations are based. For each CDT, one total test score as well as diagnostic category scores were reported (see Chapter Fourteen for more information about CDT scores). Several dimensionality studies were conducted in order to provide internal-structure evidence relating to the use of both types of scores.

## ITEM-TEST CORRELATIONS

Item-test correlations are discussed in Chapter Seven and provided in Appendix B of the 2017-2018 and 20182019 technical reports. All items in the final operational pools had values that were positive and of acceptable magnitude.

## DIMENSIONALITY

Dimensionality analyses were conducted for the CDT using WINSTEPS's principal components analyses on response residuals for each content area. Results are shown in Chapter Eight. The principal component analysis results provided evidence that each CDT test was essentially unidimensional, supporting the validity of using the total scores to estimate a student's overall ability.

## DIAGNOSTIC CATEGORY CORRELATIONS

Correlations and disattenuated correlations among diagnostic category scores for the CDT are presented below. Values were derived from the CDT operational data from the 2019-2020 school year. This data can also provide information on score dimensionality that is part of internal-structure evidence. Each CDT has either four or five diagnostic categories. Full diagnostic category names can be found in Chapter Thirteen.

The correlations in Tables 17-1 through 17-13 are based on the observed diagnostic category scores. These observed-score correlations are weakened by existing measurement error contained within each diagnostic category. As a result, disattenuated correlations could provide an estimate of the relationships among diagnostic categories if there were no measurement error. (An important caveat is explained further below.) The disattenuated correlation coefficients $\left(\mathrm{R}_{12}\right)$ can be computed by using the formula (Spearman 1904, 1910) below:

$$
R_{12}=\frac{r_{12}}{\sqrt{r_{11} r_{22}}},
$$

where $r_{12}$ is the observed correlation, and $r_{11}$ and $r_{22}$ are the reliabilities for diagnostic categories 1 and 2 . Disattenuated correlations very near 1.00 suggest that the same or very similar constructs are being measured. Values somewhat less than 1.00 suggest that different diagnostic categories are measuring slightly different aspects of the same construct. Values markedly less than 1.00 suggest the diagnostic categories reflect different constructs.

Tables 17-14 through 17-26 show the corresponding disattenuated correlations. Given that none of these diagnostic categories had perfect reliabilities (see Chapter Sixteen), the disattenuated correlations are higher than their observed score counterparts.

In reviewing the differences between the simple correlations and the disattenuated ones, it is clear that the impact of the "less than perfect" reliabilities on the disattenuated correlations is large for most of the tests. For example, Science Grades 3-5 found virtually no differences between any pair of disattenuated correlations. This indicates that, for the majority of students, the diagnostic category scores are merely shorter versions of what the total scores are measuring. Note that, while the theoretical maximum for observed correlations is 1.00 , disattenuated correlations can exceed this value when high observed correlations are combined with low reliabilities. The other tests' disattenuated correlations are somewhat lower, generally in the range of .80 to .94 . The test with the lowest disattenuated correlations is Algebra II, with Complex Numbers showing the most uniqueness.

As a practical consideration, and despite these results, diagnostic category scores for individual students may still provide useful information to the teacher. For example, a student may still have statistically significant differences between pairs of diagnostic scores ("areas of needs" versus "strengths to build on") with large observed scale score differences. The diagnostic reporting suite shows these differences in a graphic that includes the level of precision for each scale score in the form of an "error band." The error band is the scale score $\pm$ one conditional standard error. Any two pairs of scores can be interpreted as statistically different if their respective error bands do not overlap. More details about the use and interpretation of error bands may be found in Chapter Fourteen. Additionally, Chapter Fifteen provides summary information about conditional standard errors for each diagnostic category and tables that indicate the incidence of non-overlapping error bands in the 2019-2020 operational testing population.

## EXPLORATORY FACTOR ANALYSIS

In order to further explore the internal structure of each CDT, an exploratory factor analysis (EFA) of the diagnostic category scores was conducted. Operational data from the 2019-2020 school year was used to create the observed correlation matrices shown in Tables 17-1 through 17-13. These, in turn, were used in the EFA. In the Statistical Package for the Social Sciences (SPSS), Principal Axis Factor extraction was utilized with an oblique rotation (Promax) of the initial factor solution to improve interpretability. Oblique rotations allow for correlated factors.

Tables 17-27 through 17-39 present the eigenvalues and the explained variance for the extracted factors. Figures 17-1 through 17-13 are scree plot graphs of the eigenvalues against the factor number. In general, the first factor accounts for approximately $75 \%$ of the total variance for all CDT tests except Chemistry, while the second factor accounts for approximately $9 \%$ of the total variance. For Chemistry, the first factor accounts for $57 \%$ of the total variance, while the second factor accounts for $16 \%$. For each CDT, only the first factor had an eigenvalue greater than 1.0, typically suggesting a one-factor solution using the Kaiser criterion.

Table 17-27. Eigenvalues and Explained Variance for Math Grades 3-5 Diagnostic Categories

| Factor | Eigenvalue | Percent |

Taken as a whole, the internal structure evidence presented generally indicates that related elements of each of the CDT tests are correlated in the intended manner. This further supports using a total score to report students' performances in the different content areas.

The diagnostic category scores present more of a mixed message. Since the diagnostic categories in each of the CDT tests were designed to measure distinct components, it is reasonable to expect that the diagnostic category correlations should be positive and strong but, ideally, not extremely high. However, the disattenuated correlations imply that some diagnostic categories are essentially measuring the same constructs. While there is content rationale underlying the creation of the diagnostic category scores, the empirical correlations illustrate that caution is required when using these scores when identifying an individual student's areas of need and strengths to build on.

## EVIDENCE BASED ON RELATIONSHIPS WITH OTHER VARIABLES

As described in the Standards (AERA, APA, \& NCME, 2014), ". . . Evidence based on relationships with other variables provides evidence about the degree to which these relationships are consistent with the construct underlying the proposed test score interpretations" (p. 16). This category of evidence refers to "external structure evidence" and has been classified as three types of evidence: convergent, discriminant, and criterion-related. Convergent evidence is provided by relationships among students' performances on different assessments intended to measure a similar construct. Discriminant evidence is provided by relationships among students' performances on different tests intended to measure different constructs. Criterion-related evidence, either predictive or concurrent, is provided by relationships between students' test scores and their performances on a criterion measure (Cronbach, 1971; Messick, 1989).

Correlations and disattenuated correlations among students' test scores across different CDT content areas provide some discriminant validity evidence. These are provided in Tables 17-40 and 17-41.

Table 17-40a. Correlations among CDT Grades 3-5 Tests

| CDT | Math Grades 3-5 | Reading Grades 3-5 | Science Grades 3-5 | Writing Grades 3-5 |
| :--- | ---: | ---: | ---: | ---: |

| Writing Gr 6-HS | 0.772 | 0.736 | 0.683 | 0.805 | 0.869 | 0.771 | 0.777 | 0.726 | - |

Each CDT test measures a different construct, so the correlations among them were not expected to be extremely high. The values in the tables are consistent with this expectation. Correlations among the CDT tests ranged from 0.300 to 0.834 . Correlations across tests within a content area tend to be more highly correlated than across content areas. For example, the correlation between Algebra I and Geometry is 0.787 , whereas the correlation between Algebra I and Biology is 0.615 .

Typically, external evidence for the CDT is examined by using students' scores on the Pennsylvania System of School Assessment (PSSA) and/or Keystone Exams from the same school year as external criteria. However, there were no spring 2020 PSSA or Keystone scores due to the school closures as a result of Covid-19. Repeated below are the results for the previous school year. For each content area, CDT results from the 2018-2019 school year were matched to spring 2019 PSSA in the corresponding content area using the PA secure ID. Similarly, CDT tests in Algebra I, Biology, and Reading/Literature were matched to corresponding spring 2019 Keystone Exams. The correlations between students' total scale scores on the CDT and PSSA or Keystone are calculated as one piece of external evidence. Table 17-42 summarizes the sample sizes and correlations.

Table 17-42. Correlation between CDT and PSSA or Keystone Exams Scores

| Student Grade | CDT | PSSA or Keystone Test | $N$ | Correlation of Total Scale Scores |
| :---: | :---: | :---: | :---: | :---: |
| 3 | Math Grades 3-5 | PSSA Math Grade 3 | 21,400 | 0.792 |
| 4 | Math Grades 3-5 | PSSA Math Grade 4 | 23,412 | 0.807 |
| 5 | Math Grades 3-5 | PSSA Math Grade 5 | 27,187 | 0.797 |
| 6 | Math Grades 6-HS | PSSA Math Grade 6 | 30,743 | 0.817 |
| 7 | Math Grades 6-HS | PSSA Math Grade 7 | 33,055 | 0.825 |
| 8 | Math Grades 6-HS | PSSA Math Grade 8 | 27,431 | 0.803 |
| 3 | Reading Grades 3-5 | PSSA ELA Grade 3 | 18,951 | 0.802 |
| 4 | Reading Grades 3-5 | PSSA ELA Grade 4 | 20,710 | 0.823 |
| 5 | Reading Grades 3-5 | PSSA ELA Grade 5 | 23,568 | 0.823 |
| 6 | Reading/Lit Grades 6-HS | PSSA ELA Grade 6 | 25,663 | 0.793 |
| 7 | Reading/Lit Grades 6-HS | PSSA ELA Grade 7 | 29,167 | 0.787 |
| 8 | Reading/Lit Grades 6-HS | PSSA ELA Grade 8 | 28,428 | 0.782 |
| 4 | Science Grades 3-5 | PSSA Science Grade 4 | 12,392 | 0.778 |
| 8 | Science Grades 6-HS | PSSA Science Grade 8 | 28,136 | 0.772 |
| 3 | Writing Grades 3-5 | PSSA ELA Grade 3 | 1,963 | 0.778 |
| 4 | Writing Grades 3-5 | PSSA ELA Grade 4 | 2,349 | 0.805 |
| 5 | Writing Grades 3-5 | PSSA ELA Grade 5 | 3,336 | 0.784 |
| 6 | Writing/Eng Comp Gr 6-HS | PSSA ELA Grade 6 | 5,051 | 0.786 |
| 7 | Writing/Eng Comp Gr 6-HS | PSSA ELA Grade 7 | 7,861 | 0.774 |
| 8 | Writing/Eng Comp Gr 6-HS | PSSA ELA Grade 8 | 6,957 | 0.749 |
| 6-12 | Algebra I | Keystone Algebra I | 38,861 | 0.779 |
| 6-12 | Biology | Keystone Biology | 50,808 | 0.803 |
| 6-12 | Reading/Literature | Keystone Literature | 46,126 | 0.747 |

These results provide external evidence in support of CDT as a valid measure of students' achievement.
The collection of external evidence related to the CDT is an ongoing process. As more CDT data become available, other criterion-related evidence will be evaluated. In addition to examining the relationship between CDT and PSSA or Keystone Exams, other criterion variables such as Scholastic Aptitude Test (SAT) scores, American College Test (ACT) scores, or student grade point average (GPA) may be considered.

## EVIDENCE BASED ON CONSEQUENCES OF TESTS

According to the Standards (AERA, APA, \& NCME, 2014), evidence of the consequences of implementing an assessment program is an additional source of validity information. Both positive and negative (intended and unintended) consequences of score-based inferences must be investigated to fully evaluate the pool of validity evidence.

Lane and Stone (2002) summarized the general intended consequences for state assessments and accountability programs:

- Student, teacher, and administrator motivation and effort
- Curriculum and instruction practices (including content and strategies)
- Improved learning for all students
- Content and format of classroom assessments
- Professional development support
- Use and nature of test preparation activities
- Student, teacher, administrator, and public awareness and beliefs about the assessment, criteria for judging performance, and the use of assessment results

Evidence for the improvement of student learning can be seen by looking at the changes in scale scores for students who took the same CDT test multiple times. Table 17-43 below summarizes scale score changes between the first and last administrations of the CDT.

Table 17-43. Summary of Scale Score Changes between CDT Administrations

| CDT | $N$ | Minimum | Q1 | Median | Mean | Q3 | Maximum |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Math Grades 3-5 | 54,114 | -601 | 13 | 62 | 64.43 | 114 | 759 |
| Math Grades 6-HS | 63,470 | -630 | -18 | 35 | 32.84 | 87 | 808 |
| Algebra I | 26,280 | -522 | -31 | 31 | 25.39 | 88 | 1262 |
| Geometry | 1,678 | -484 | -10 | 58 | 55.90 | 120 | 624 |
| Algebra II | 1,288 | -392 | 4 | 63 | 61.00 | 124 | 601 |
| Reading Grades 3-5 | 51,484 | -423 | -17 | 39 | 39.81 | 95 | 492 |
| Reading/Lit Grades 6-HS | 96,983 | -608 | -51 | 6 | 5.03 | 63 | 630 |
| Science Grades 3-5 | 12,437 | -563 | -13 | 39 | 41.81 | 92 | 601 |
| Science Grades 6-HS | 31,625 | -508 | -41 | 14 | 12.30 | 68 | 828 |
| Biology | 26,748 | -519 | -18 | 46 | 42.10 | 107 | 797 |
| Chemistry | 1,209 | -475 | 1 | 62 | 59.29 | 119 | 417 |
| Writing Grades 3-5 | 8,919 | -483 | -8 | 46 | 48.67 | 101 | 769 |
| Writing/Eng Comp Gr 6-HS | 16,287 | -547 | -48 | 11 | 7.21 | 67 | 559 |

Lane and Stone (2002) also summarized the possible unintended outcomes:

- Narrowing of curriculum and instruction to focus only on the specific standards assessed and ignoring the broader construct reflected in the specified standards
- Use of test preparation materials that are closely linked to the assessment without making changes to instruction
- Use of unethical test preparation materials or administration procedures
- Differential performance gains for subgroups of students
- Inappropriate or unfair uses of test scores, such as questionable practices in reassignment of teachers or principals
- For some students, decreased confidence and motivation to learn and to perform well on the assessment because of past experiences with assessments

As noted above, one important piece of consequential evidence pertains to the use of assessment results. As shown in Chapter Fourteen, CDT offers a dynamic suite of reports. The extent to which various groups of users (e.g., students and teachers) interpret these reports appropriately affects the validity of subsequent uses of these results. As noted in Chapter Fourteen, there are report training scenarios for each content area. The intent is that the scenarios will help users avoid unintended uses and interpretations of the CDT results.

## EVIDENCE RELATED TO USE OF THE RASCH MODEL

Since the Rasch model is the basis of all calibration, scaling, and equating analyses associated with the CDT, the validity of the inferences from these results depends on the degree to which the assumptions of the model are met, as well as the fit between the model and the test data. As discussed in Chapter Eight, the underlying assumptions of Rasch models were essentially met for all the CDT data, indicating the appropriateness of using Rasch models to analyze the CDT data.

## VALIDITY EVIDENCE SUMMARY

Validity evidence related to test content was reviewed earlier in this chapter. On the whole, the early chapters of this technical report show that a strong link can be established between each CDT item and its associated Eligible Content. Detailed information regarding educator reviews are presented in Chapter Six.

Diagnostic category score intercorrelations were also presented in this chapter. They provide some favorable evidence regarding the internal relationships between the tests' components.

Validity of score inferences is bolstered when test scores are consistent. Here, the reliabilities of the total test scores (presented in Chapter Sixteen) were very good, with many in the low 0.90 s.

Reported in Chapter Six, differential item functioning (DIF) with respect to gender and ethnicity helps address construct-irrelevant variance, which represents an important threat to the validity of inferences made from achievement test scores. As noted in that chapter, field-test items are screened and reviewed for DIF. Only items approved by teacher committees are eligible for operational use.

## CHAPTER EIGHTEEN: PARAMETER STABILITY

The Classroom Diagnostic Tools (CDT) features a number of tests. Tests in Mathematics, Algebra I, Geometry, and Algebra II have been available since October 2010 for students in grades 6 and above. Tests in Reading/ Literature, Science, Biology, and Chemistry have been available since April 2011 for students in grades 6 and above. Tests in Writing /English Composition have been available since October 2011 for students in grades 6 and above. Tests in Mathematics, Reading, Science, and Writing have been available since April 2014 for students in grades 3 through 5 . During the 2019-2020 school year, CAT item selection and Rasch ability estimates were based on initial item parameters estimated from the stand-alone and embedded field-test events and vertical linking (see Chapter Eight and Chapter Nine for details). The only exceptions were 113 items in the mathematics content area that had parameters re-estimated following the 2010-2011 school year and 74 items in the science content area that had parameters re-estimated following the 2011-2012 school year. Following the 2019-2020 school year, item parameter stability was checked for all items in the banks.

## METHODOLOGY

In the first two years of CDT, four separate methods were investigated to evaluate the stability of the item parameters in the CDT operational administration

1. Calibrate the entire bank within a content area in a single concurrent calibration. Do not anchor item parameters on banked values. Compare new parameter estimates to the banked values.
2. Calibrate the entire bank within a content area in a single concurrent calibration. Anchor item parameters on banked values. Examine displacements.
3. Calibrate each grade/course level item with students in that grade/course. Do not anchor item parameters on banked values. Compare new parameter estimates to the banked values.
4. Calibrate each grade/course level item with students in that grade/course. Anchor item parameters on banked values. Examine displacements.

As noted in Chapter Twelve, CDT tests are pre-equated. Immediate score reports are based on banked item parameters. Therefore, this chapter focuses on anchored calibrations and examination of displacement values to evaluate item parameter stability ${ }^{1}$.

## ANCHORED CONCURRENT CALIBRATION WITHIN CONTENT AREA ACROSS GRADES/ COURSES

One method used to evaluate the stability of the item parameters in the operational administration was to calibrate the entire bank within a content area anchoring on the banked item parameters and examine the displacements. For each item, the displacement value is the size of the change in the parameter estimate that would be estimated if the parameter for the item was unanchored and all other parameters were anchored at their current value. Given that the banked values were developed into a single, vertical scale, all items within a content area were calibrated in a single concurrent calibration using WINSTEPS software version 3.71 (Linacre, 2009).

## MATHEMATICS

Figure 18-1 shows the displacements from a concurrent anchored calibration of all mathematics items using the operational data set. Items are color-coded by grade/course.

[^30]Figure 18-1. Anchored Calibration Displacements - All Items

Note: Many kindergarten and grade 1 items were not estimated by WINSTEPS software due to insufficient counts.
Table 18-1 summarizes the data in Figure 18-1. It contains item counts by grade/course and displacements in intervals of 0.1 logits. According to the WINSTEPS manual, in an anchored calibration, half of the displacements are expected to be negative and half positive. Displacements less than 0.5 in magnitude are considered small (unlikely to have much impact). Seventy-six percent of the items in the bank have a displacement less than 0.5 in magnitude (gray shaded in Table 18-1).

Table 18-1. Number of Mathematics Items by Grade/Course and Displacement Interval

Figure 18-2 shows banked item difficulties plotted against the item difficulties plus displacement from the anchored concurrent calibration of operational data for the mathematics item bank. A line of best fit is included in the upper plot. If item difficulties from the operational calibration are close to the banked values, the line will approach an intercept of zero and a slope of one. The lower plot displays the same data as the upper, but color codes items by grade/course in an attempt to lend insight into the possible causes for the deviations.

Figure 18-2. Mathematics Banked Item Parameters vs. Anchored Calibration - All Items

Based on Figure 18-2, one can see that there are a number of items with operational estimates that differ from their banked values. Some of these are in kindergarten through grade 2. Recall that the operational CDT is available to students in grade 3 and above. While items were developed to sample content in kindergarten through grade 2 to provide better diagnostic information for lower-performing students, the data from the operational administration did not include students below grade 3. To investigate whether this had an impact on the stability of the item parameter estimates, a concurrent anchored calibration of all items in grade 3 and above was run.

Figure 18-3 and Table 18-2 summarize the displacements from a concurrent anchored calibration of all items in grade 3 and above. Seventy-seven percent of the items in the calibration have displacement less than 0.5 in magnitude (gray shaded in Table 18-2). Figure 18-4 shows banked item difficulties plotted against the item difficulties plus displacement. Again, a line of best fit is included in the upper plot.

Figure 18-4. Mathematics Banked Item Parameters vs. Anchored Calibration - All Items in Grade 3 and Above

It is evident from this series of plots that the item parameter estimates are reasonably stable for the items in grade 3 and above.

For both of the anchored calibrations described in this section, banked item parameters were compared to the banked item parameters plus the displacements by calculating a robust $Z$ statistic for each item pairing. If item difficulties from the operational calibration are close to the banked values, the correlation will be high and the additive constant near zero. Table 18-3 shows the number of items in each grade/course and the number and percent of items with absolute value of robust $Z$ greater than 1.645 in each of the calibrations.

Table 18-3. Summary of Robust $Z$ across Anchored Calibrations in Mathematics

| Grade/ Course | Gal 1: Number of Items | $\begin{aligned} & \text { Cal 1: Number } \\ & \text { of Items with } \\ & \text { ABS(Z) }>1.645 \end{aligned}$ | Cal 1: Percent of Items with ABS(Z) > 1.645 | Cal 2: Number of Items | Gal 2: Number of Items with ABS(Z) > 1.645 | Cal 2: Percent of Items with ABS(Z) > 1.645 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Kindergarten | 0 | 0 | N/A | 0 | 0 | N/A |
| Grade 1 | 2 | 0 | 0\% | 0 | 0 | N/A |
| Grade 2 | 161 | 45 | 28\% | 0 | 0 | N/A |
| Grade 3 | 518 | 176 | 34\% | 518 | 189 | 36\% |
| Grade 4 | 589 | 124 | 21\% | 589 | 134 | 23\% |

| Geometry | 425 | 47 | 11\% | 425 | 47 | 11\% |
| Algebra II | 441 | 66 | 15\% | 441 | 67 | 15\% |
| Total | 4993 | 754 | 15\% | 4830 | 739 | 15\% |
|  | Correlation $=0.960$ |  |  | Correlation $=0.955$ |  |  |
|  | Additive Constant $=-0.049$ |  |  | Additive Constant $=-0.045$ |  |  |

For the most part, whether high absolute displacement values or robust $Z$ was used to identify items with operational estimates that differ from banked values, the same items were identified. For example, in calibration 2, all items with absolute displacement greater than 0.328 have an absolute value of robust $Z$ greater than 1.645 . In the displacement range of 0.624 to 0.628 , some items have absolute value of robust $Z$ greater than 1.645 while others do not. No items with absolute displacement less than 0.624 have absolute value of robust $Z$ greater than 1.645.

## READING/LITERATURE

Figure 18-5 shows the displacements from a concurrent anchored calibration of all reading items using the operational data set. Items are color-coded by grade/course.

Figure 18-5. Reading Anchored Calibration Displacements - All Items

Table 18-4 summarizes the data in Figure 18-5. It contains item counts by grade/course and displacements in intervals of 0.1 logits. According to the WINSTEPS manual, in an anchored calibration, half of the displacements are expected to be negative and half positive. Displacements less than 0.5 in magnitude are considered small (unlikely to have much impact). Eighty-three percent of the items in the bank have a displacement less than 0.5 in magnitude (gray shaded in Table 18-4).

|  | Correlation $=0.935$ |  |  | Correlation $=0.926$ |  |  |
|  | Additive Constant $=0.042$ |  |  | Additive Constant $=0.016$ |  |  |

For the most part, whether high absolute displacement values or robust $Z$ was used to identify items with operational estimates that differ from banked values, the same items were identified. For example, in calibration 1, all items with absolute displacement greater than 0.490 have an absolute value of robust $Z$ greater than 1.645. In the displacement range of 0.477 to 0.490 , some items have absolute value of robust $Z$ greater than 1.645 while others do not. No items with absolute displacement less than 0.477 have absolute value of robust $Z$ greater than 1.645.

## SCIENCE

Figure 18-9 shows the displacements from a concurrent anchored calibration of all science items using the operational data set. Items are color-coded by grade/course.

Figure 18-9. Science Anchored Calibration Displacements - All Items

Table 18-7 summarizes the data in Figure 18-9. It contains item counts by grade/course and displacements in intervals of 0.1 logits. According to the WINSTEPS manual, in an anchored calibration, half of the displacements are expected to be negative and half positive. Displacements less than 0.5 in magnitude are considered small (unlikely to have much impact). Eighty-nine percent of the items in the bank have a displacement less than 0.5 in magnitude (gray shaded in Table 18-7).

Figure 18-10 shows banked item difficulties plotted against the item difficulties plus displacement from the anchored concurrent calibration of operational data for the science item bank. A line of best fit is included in the upper plot. If item difficulties from the operational calibration are close to the banked values, the line will approach an intercept of zero and a slope of one. The lower plot displays the same data as the upper, but color codes items by grade/course in an attempt to lend insight into the possible causes for the deviations.

Figure 18-10. Science Banked Item Parameters vs. Anchored Calibration - All Items

Based on Figure 18-10, one can see that there are a number of items with operational estimates that differ from their banked values. Some of these are in the K-2 span. Recall that the operational CDT is available to students in grade 3 and above. While items were developed to sample content in the $\mathrm{K}-2$ span to provide better diagnostic information for lower performing students, the data from the operational administration did not include students below grade 3 . To investigate whether this had an impact on the stability of the item parameter estimates, a concurrent anchored calibration of all items in grade 3 and above was run.

Figure 18-11 and Table 18-8 summarize the displacements from a concurrent anchored calibration of all items in grade 3 and above. Ninety percent of the items in the calibration have displacement less than 0.5 in magnitude (gray shaded in Table 18-8). Figure 18-12 shows banked item difficulties plotted against the item difficulties plus displacement. Again, a line of best fit is included in the upper plot.

Figure 18-12. Science Banked Item Parameters vs. Anchored Calibration - All Items in Grade 3 and Above

It is evident from this series of plots that the item parameter estimates are reasonably stable for the items in grade 3 and above.

For both of the anchored calibrations described in this section, banked item parameters were compared to the banked item parameters plus the displacements by calculating a robust $Z$ statistic for each item pairing. If item difficulties from the operational calibration are close to the banked values, the correlation will be high and the additive constant near zero. Table 18-9 shows the number of items in each grade/course and the number and percent of items with absolute value of robust $Z$ greater than 1.645 in each of the calibrations.

Table 18-9. Summary of Robust $Z$ across Anchored Calibrations in Science

| Grade/ Course | Gal 1: Number of Items | Gal 1: Number of Items with ABS(Z) > 1.645 | Cal 1: Percent of Items with ABS(Z) $>1.645$ | Cal 2: Number of Items | Cal 2: Number of Items with $\operatorname{ABS}(Z)>1.645$ | Gal 2: Percent of Items with ABS(Z) > 1.645 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| K-2 span | 301 | 88 | 29\% | 0 | 0 | N/A |
| Grade 3 | 326 | 64 | 20\% | 326 | 69 | 21\% |
| Grade 4 | 408 | 64 | 16\% | 408 | 68 | 17\% |
| Grade 5 | 328 | 38 | 12\% | 328 | 40 | 12\% |
| Grade 6 | 325 | 31 | 10\% | 325 | 35 | 11\% |
| Grade 7 | 521 | 51 | 10\% | 521 | 55 | 11\% |

| Chemistry | 423 | 36 | 9\% | 423 | 39 | 9\% |
| Total | 4163 | 526 | 13\% | 3862 | 471 | 12\% |
|  | Correlation $=0.970$ |  |  | Correlation $=0.965$ |  |  |
|  | Additive Constant $=0.001$ |  |  | Additive Constant $=0.007$ |  |  |

For the most part, whether high absolute displacement values or robust $Z$ was used to identify items with operational estimates that differ from banked values, the same items were identified. For example, in calibration 1, all items with absolute displacement greater than 0.498 have an absolute value of robust $Z$ greater than 1.645 . In the displacement range of 0.461 to 0.498 , some items have absolute value of robust $Z$ greater than 1.645 while others do not. No items with absolute displacement less than 0.461 have absolute value of robust $Z$ greater than 1.645.

## WRITING/ENGLISH COMPOSITION

Figure 18-13 shows the displacements from a concurrent anchored calibration of all writing items using the operational data set. Items are color-coded by grade/course.

Figure 18-13. Writing Anchored Calibration Displacements - All Items

Note: Many kindergarten items were not estimated by WINSTEPS software due to insufficient counts.
Table 18-10 summarizes the data in Figure 18-13. It contains item counts by grade/course and displacements in intervals of 0.1 logits. According to the WINSTEPS manual, in an anchored calibration, half of the displacements are expected to be negative and half positive. Displacements less than 0.5 in magnitude are considered small (unlikely to have much impact). Eighty-six percent of the items in the bank have a displacement less than 0.5 in magnitude (gray shaded in Table 18-10).

|  | Additive Constant $=0.000$ |  |  | Additive Constant $=0.000$ |  |  |

For the most part, whether high absolute displacement values or robust $Z$ was used to identify items with operational estimates that differ from banked values, the same items were identified. For example, in calibration 1, all items with absolute displacement greater than 0.573 have an absolute value of robust $Z$ greater than 1.645 . In the displacement range of 0.552 to 0.573 , some items have absolute value of robust $Z$ greater than 1.645 while others do not. No items with absolute displacement less than 0.552 have absolute value of robust $Z$ greater than 1.645.

## ANCHORED GRADE LEVEL CALIBRATIONS

While the CDT content area item banks are vertically scaled with items from Kindergarten through high school courses, the assessments themselves are first made available in grade 3. Also, while the items are selected adaptively, most students take a large number of items at grade level. Given these conditions, item parameters were also evaluated by running anchored grade level item calibrations-grade 3 items calibrated with grade 3 students, and so on. This is similar to how field-test items were calibrated. Table 18-13 shows the number of students in each grade level calibration.

Table 18-13. Number of Students in Grade Level Calibrations

## MATHEMATICS

Figure 18-17 shows the displacements from the anchored grade level calibrations of operational data for the mathematics item bank. Items are color-coded by grade/course.

Figure 18-17. Mathematics Anchored Grade Level Calibrations Displacements - All Items in Grade 3 and Above

Table 18-14 summarizes the data in Figure 18-17. It contains item counts by grade/course and displacements in intervals of 0.1 logits. According to the WINSTEPS manual, in an anchored calibration, half of the displacements are expected to be negative and half positive. Displacements less than 0.5 in magnitude are considered small (unlikely to have much impact). Seventy-five percent of the items in the bank have a displacement less than 0.5 in magnitude (gray shaded in Table 18-14).

Figure 18-18 shows banked item difficulties plotted against the item difficulties plus displacement from the anchored grade level calibrations of all items using the operational data set. Again, a line of best fit is included in the upper plot.

Figure 18-18. Mathematics Banked Item Parameters vs. Anchored Grade Level Calibrations - All Items in Grade 3 and Above

For the anchored grade level calibrations described above, banked item parameters were compared to the newly calibrated values by calculating a robust $Z$ statistic for each item pairing. If item difficulties from the operational calibration are close to the banked values, the correlation will be high and the additive constant near zero. Table 18-15 shows the number of items in each grade/course and the number and percent of items with absolute value of robust $Z$ greater than 1.645 in the calibrations.

Table 18-15. Summary of Robust $Z$ across Anchored Grade Level Calibrations in Mathematics

| Grade/ Gourse | Cal 1: Number <br> of Items | Cal 1: Number <br> of Items with <br> ABS(Z) > 1.645 | Cal 1: Percent <br> of Items with <br> ABS(Z) > 1.645 |
| :--- | ---: | ---: | ---: |
| Kindergarten | 0 | 0 | $\mathrm{~N} / \mathrm{A}$ |$|$| $\mathrm{N} / \mathrm{A}$ |
| :--- |
| Grade 1 |
| Grade 2 |

For the most part, whether high absolute displacement values or robust $Z$ was used to identify items with operational estimates that differ from banked values, the same items were identified. For example, all items with absolute displacement greater than 0.670 have an absolute value of robust $Z$ greater than 1.645 . In the displacement range of 0.617 to 0.670 , some items have absolute value of robust $Z$ greater than 1.645 while others do not. No items with absolute displacement less than 0.617 have absolute value of robust $Z$ greater than 1.645.

## READING/LITERATURE

Figure 18-19 shows the displacements from the anchored grade level calibrations of operational data for the reading item bank. Items are color-coded by grade/course.

Figure 18-19. Reading Anchored Grade Level Calibrations Displacements - All Items in Grade 3 and Above

Table 18-16 summarizes the data in Figure 18-19. It contains item counts by grade/course and displacements in intervals of 0.1 logits. According to the WINSTEPS manual, in an anchored calibration, half of the displacements are expected to be negative and half positive. Displacements less than 0.5 in magnitude are considered small (unlikely to have much impact). Eighty-five percent of the items in the bank have a displacement less than 0.5 in magnitude (gray shaded in Table 18-16).

Figure 18-20 shows banked item difficulties plotted against the item difficulties plus displacement from the anchored grade level calibrations of all items using the operational data set. Again, a line of best fit is included in the upper plot.

Figure 18-20. Reading Banked Item Parameters vs. Anchored Grade Level Calibrations - All Items in Grade 3 and Above

An examination of the items with larger differences between banked values and operational estimates revealed that a number of these have low $n$-counts in the operational calibration. To investigate whether this had an impact on the stability of the item parameter estimates, anchored grade level calibrations of all items in grade 3 and above with larger n-counts were run. Figure 18-21 shows the displacements from these calibrations. Items are colorcoded by grade/course.

Figure 18-21. Reading Anchored Grade Level Calibrations Displacements - All Items in Grade 3 and Above with $N>100$

Table 18-17 summarizes the data in Figure 18-21. It contains item counts by grade/course and displacements in intervals of 0.1 logits. According to the WINSTEPS manual, in an anchored calibration, half of the displacements are expected to be negative and half positive. Displacements less than 0.5 in magnitude are considered small (unlikely to have much impact). Eighty-six percent of the items in the bank have a displacement less than 0.5 in magnitude (gray shaded in Table 18-17).

Figure 18-24 shows banked item difficulties plotted against the item difficulties plus displacement from the anchored grade level calibrations of all items using the operational data set. Again, a line of best fit is included in the upper plot.

Figure 18-24. Science Banked Item Parameters vs. Anchored Grade Level Calibrations - All Items in Grade 3 and Above

An examination of the items with larger differences between banked values and operational estimates revealed that a number of these have low $n$-counts in the operational calibration. To investigate whether this had an impact on the stability of the item parameter estimates, anchored grade level calibrations of all items in grade 3 and above with larger n-counts were run. Figure 18-25 shows the displacements from these calibrations. Items are colorcoded by grade/course.

Figure 18-25. Science Anchored Grade Level Calibrations Displacements - All Items in Grade 3 and Above with $N>100$

Table 18-20 summarizes the data in Figure 18-25. It contains item counts by grade/course and displacements in intervals of 0.1 logits. According to the WINSTEPS manual, in an anchored calibration, half of the displacements are expected to be negative and half positive. Displacements less than 0.5 in magnitude are considered small (unlikely to have much impact). Eighty-eight percent of the items in the bank have a displacement less than 0.5 in magnitude (gray shaded in Table 18-20).

Figure 18-26 mirrors Figure 18-24, except the calibrations exclude items with fewer than 100 administrations. Again, a line of best fit is included in the upper plot.

Figure 18-26. Science Banked Item Parameters vs. Anchored Grade Level Calibrations - All Items in Grade 3 and Above with $N>100$

For the two sets of anchored grade level calibrations described above, banked item parameters were compared to the newly calibrated values by calculating a robust $Z$ statistic for each item pairing. If item difficulties from the operational calibration are close to the banked values, the correlation will be high and the additive constant near zero. Table 18-21 shows the number of items in each grade/course and the number and percent of items with absolute value of robust $Z$ greater than 1.645 in the calibrations.

Table 18-21. Summary of Robust $Z$ across Two Sets of Anchored Grade Level Calibrations in Science

| Grade/ Course | Cal 1: Number of Items | Gal 1: Number of Items with ABS(Z) > 1.645 | Gal 1: Percent of Items with ABS(Z) > 1.645 | Gal 2: Number of Items | Gal 2: Number of Items with ABS (Z) > 1.645 | Gal 2: Percent of Items with $\operatorname{ABS}(Z)>1.645$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| K-2 span | 0 | 0 | N/A | 0 | 0 | N/A |
| Grade 3 | 326 | 89 | 27\% | 172 | 48 | 28\% |
| Grade 4 | 408 | 63 | 15\% | 407 | 71 | 17\% |
| Grade 5 | 328 | 85 | 26\% | 267 | 72 | 27\% |
| Grade 6 | 325 | 35 | 11\% | 325 | 37 | 11\% |
| Grade 7 | 521 | 52 | 10\% | 521 | 56 | 11\% |
| Grade 8 | 654 | 59 | 9\% | 654 | 67 | 10\% |
| Grade 11 | 99 | 30 | 30\% | 7 | 2 | 29\% |
| Biology | 775 | 79 | 10\% | 775 | 93 | 12\% |
| Chemistry | 423 | 44 | 10\% | 388 | 45 | 12\% |
| Total | 3859 | 536 | 14\% | 3516 | 491 | 14\% |
|  | Correlation $=0.958$ |  |  | Correlation $=0.962$ |  |  |
|  | Additive Constant $=0.023$ |  |  | Additive Constant $=0.021$ |  |  |

For the most part, whether high absolute displacement values or robust $Z$ was used to identify items with operational estimates that differ from banked values, the same items were identified. For example, in calibration 1, all items with absolute displacement greater than 0.526 have an absolute value of robust $Z$ greater than 1.645 . In the displacement range of 0.461 to 0.526 , some items have absolute value of robust $Z$ greater than 1.645 while others do not. No items with absolute displacement less than 0.461 have absolute value of robust $Z$ greater than 1.645.

## WRITING/ENGLISH COMPOSITION

Figure 18-27 shows the displacements from the anchored grade level calibrations of operational data for the writing item bank. Items are color-coded by grade/course.

Figure 18-27. Writing Anchored Grade Level Calibrations Displacements - All Items in Grade 3 and Above

Table 18-22 summarizes the data in Figure 18-27. It contains item counts by grade/course and displacements in intervals of 0.1 logits. According to the WINSTEPS manual, in an anchored calibration, half of the displacements are expected to be negative and half positive. Displacements less than 0.5 in magnitude are considered small (unlikely to have much impact). Eighty-four percent of the items in the bank have a displacement less than 0.5 in magnitude (gray shaded in Table 18-22).

Figure 18-30 mirrors Figure 18-28, except the calibrations exclude items with fewer than 100 administrations. Again, a line of best fit is included in the upper plot.

Figure 18-30. Writing Banked Item Parameters vs. Anchored Grade Level Calibrations - All Items in Grade 3 and Above with $N>100$

For the two sets of anchored grade level calibrations described above, banked item parameters were compared to the newly calibrated values by calculating a robust $Z$ statistic for each item pairing. If item difficulties from the operational calibration are close to the banked values, the correlation will be high and the additive constant near zero. Table 18-24 shows the number of items in each grade/course and the number and percent of items with absolute value of robust $Z$ greater than 1.645 in the calibrations.

Table 18-24. Summary of Robust $Z$ across Two Sets of Anchored Grade Level Calibrations in Writing

| Grade/ Course | Gal 1: Number of Items | Gal 1: Number of Items with ABS(Z) > 1.645 | Gal 1: Percent of Items with ABS(Z) > 1.645 | Gal 2: Number of Items | Gal 2: Number of Items with $\operatorname{ABS}(Z)>1.645$ | Gal 2: Percent of Items with ABS(Z) > 1.645 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Kindergarten | 0 | 0 | N/A | 0 | 0 | N/A |
| Grade 1 | 0 | 0 | N/A | 0 | 0 | N/A |
| Grade 2 | 0 | 0 | N/A | 0 | 0 | N/A |
| Grade 3 | 361 | 56 | 16\% | 325 | 47 | 14\% |
| Grade 4 | 331 | 49 | 15\% | 319 | 49 | 15\% |
| Grade 5 | 309 | 49 | 16\% | 307 | 47 | 15\% |
| Grade 6 | 361 | 37 | 10\% | 360 | 37 | 10\% |
| Grade 7 | 349 | 29 | 8\% | 349 | 31 | 9\% |
| Grade 8 | 325 | 33 | 10\% | 325 | 37 | 11\% |
| English Comp | 733 | 81 | 11\% | 731 | 85 | 12\% |
| Total | 2769 | 334 | 12\% | 2716 | 333 | 12\% |
|  | Correlation $=0.951$ |  |  | Correlation $=0.951$ |  |  |
|  | Additive Constant $=0.022$ |  |  | Additive Constant $=0.021$ |  |  |

For the most part, whether high absolute displacement values or robust $Z$ was used to identify items with operational estimates that differ from banked values, the same items were identified. For example, in calibration 1, all items with absolute displacement greater than 0.582 have an absolute value of robust $Z$ greater than 1.645 . In the displacement range of 0.533 to 0.582 , some items have absolute value of robust $Z$ greater than 1.645 while others do not. No items with absolute displacement less than 0.533 have absolute value of robust $Z$ greater than 1.645.

For each of the content areas, it is evident from this series of plots that the item parameter estimates are reasonably stable for the items in grade 3 and above.

## CHAPTER NINETEEN: REVISION OF BENCHMARK CUTS

As described in Chapter Fourteen, CDT scores are placed along a continuum from "Areas of Need" to "Strengths to Build On." These are represented in the dynamic reporting suite with colors red, green, and blue. "Areas of Need" are depicted in the red range, while "Strengths to Build On" are depicted in the green and blue ranges. The center of the green range for grades 5 and above was established by panels of Pennsylvania educators during preliminary benchmarking activities (see Chapter Ten for details). The center of the green range for grades 2 through 4 was extrapolated from grades 5 and above prior to the launch of the CDT tests for students in grades 3 through 5 in spring of 2014.

The preliminary benchmarking activities took place prior to the first operational administration in each content area so that, once operational, immediate score reports would be available to students and teachers. Given that the preliminary benchmark cuts were set prior to the operational administration and based on field-test data, it was planned at that time to revisit the location of the cut scores after enough operational data had been collected. The preliminary benchmark cut points in the mathematics content area were analyzed and revised based on operational data following the 2010-2011 school year. The preliminary benchmark cut points in the reading, science, and writing content areas were analyzed and revised based on operational data following the 2011-2012 school year.

The introduction of CDT tests for students in grades 3 through 5 in spring 2014 required benchmark cuts for grades 2 through 4. For each content area, the benchmark cuts in place for the 2013-2014 school year in grades 5 and above were used to extrapolate cuts in grades 2 through 4.

Prior to the start of the 2015-2016 school year, the benchmark cut points in mathematics, reading, and writing were revised based on the revised Pennsylvania System of School Assessments (PSSA) tests and cut points established in spring 2015.

This chapter summarizes changes to the benchmark cuts.

## FIRST REVISION OF BENCHNARK CUTS BASED ON OPERATIONAL DATA

In each content area, the benchmark cut points set during preliminary benchmarking activities were analyzed based on matched data sets - operational CDT with PSSA and Keystone Exams (Keystone). CDT benchmark cuts were not revised to exactly match PSSA and Keystone cuts or be predictive. However, CDT, PSSA, and Keystone are based on the same eligible content. As such, it is reasonable to expect that students who do well on CDT will do well on PSSA/Keystone and vice versa. In looking at CDT results matched to PSSA and Keystone results it was determined that many students who scored in the CDT red range scored Proficient or Advanced on PSSA or Keystone suggesting that CDT benchmark cuts were set too high. Therefore, CDT benchmark cuts were lowered to make CDT red/green/blue classifications more consistent with PSSA and Keystone results. See Chapter Nineteen of the 2010-2011 and 2011-2012 technical reports for details. Table 19-1 provides a summary of the first revisions to the benchmark cut points.

Table 19-1. Summary of First Revision to Benchmark Cuts

| Content Area | Course /Grade | Benchmarking <br> Logit Cut Point | First <br> Revision to <br> Logit Cut <br> Point | Difference in <br> Logit Cut Point | Difference in <br> Scale Score |

## EXTRAPOLATION OF BENCHMARK CUTS FOR GRADES 2 THROUGH 4

The introduction of CDT tests for students in grades 3 through 5 in spring 2014 required benchmark cuts for grades 2 through $4^{1}$. For each content area, the benchmark cuts in place for the 2013-2014 school year in grades 5 and above were used to extrapolate cuts in grades 2 through 4. See Chapter Nineteen of the 2013-2014 technical report for details.

[^31]
## REVISION OF BENCHMARK CUTS BASED ON CHANGES TO PSSA

In spring 2015, changes were made to PSSA test designs and cut points in mathematics and English language arts. In light of these changes, CDT benchmark cuts were analyzed again using matched data sets - operational CDT with PSSA and Keystone. The new PSSA cut points approved in July 2015 represented higher, more rigorous, standards. Therefore, CDT benchmark cuts in mathematics, reading, and writing were raised to make CDT red/ green/blue classifications more consistent with PSSA. See Chapter Nineteen of the 2015-2016 technical report for details. Table 19-2 provides a summary of the revisions to the benchmark cut points based on changes to PSSA.

Table 19-2. Summary of Second Revision to Benchmark Cuts

| CDT | Course /Grade | $\begin{array}{r} 2014-2015 \\ \text { Logit Cut Point } \end{array}$ | $\begin{array}{r} \text { 2015-2016 } \\ \text { Logit Cut Point } \end{array}$ | Difference in Logit Gut Point | Difference in Scale Score |
| :---: | :---: | :---: | :---: | :---: | :---: |

BENCHMARK CUTS FOR ALL GRADES AND COURSES FOR THE 2019-2020 SCHOOL YEAR

Table 19-3 shows the benchmark cuts used for student reporting during the 2019-2020 school year in the logit metric for each content area. Also presented are the scale score ranges for each color on the CDT reports.

Table 19-3. Benchmark Cuts and Scale Score Ranges for the 2019-2020 School Year

| CDT | Course/Grade | Logit Cut Point (Center of Green) | Red Scale Score Range | Green Scale Score Range | Blue Scale Score Range |
| :---: | :---: | :---: | :---: | :---: | :---: |

## APPENDIX B: FIELD TEST ITEM STATISTICS

This appendix contains classical item statistics for all items field tested during the 2019-2020 school year.

## MATHEMATICS MULTIPLE-CHOICE ITEMS

There were no multiple-choice items in the mathematics content area field tested during the 2019-2020 school year. Classical item statistics for all items field tested prior to 2018-2019 can be found in Appendix B of the 20172018 technical report. Classical item statistics for items field tested in 2018-19 can be found in Appendix B of the 2018-2019 technical report.

## READING/LITERATURE MULTIPLE-CHOICE ITEMS

There were no multiple-choice items in the reading content area field tested during the 2019-2020 school year. Classical item statistics for all items field tested prior to 2018-2019 can be found in Appendix B of the 2017-2018 technical report. Classical item statistics for items field tested in 2018-19 can be found in Appendix B of the 2018-2019 technical report.

## SCIENCE MULTIPLE-CHOICE ITEMS

There were no multiple-choice items in the science content area field tested during the 2019-2020 school year. Classical item statistics for all items field tested prior to 2018-2019 can be found in Appendix B of the 2017-2018 technical report. Classical item statistics for items field tested in 2018-2019 can be found in Appendix B of the 2018-2019 technical report.

## WRITING/ENGLISH COMPOSITION MULTIPLE-CHOICE ITEMS

There were no multiple-choice items in the writing content area field tested during the 2019-2020 school year. Classical item statistics for all items field tested prior to 2018-2019 can be found in Appendix B of the 2017-2018 technical report. Classical item statistics for items field tested in 2018-2019 can be found in Appendix B of the 2018-2019 technical report.

## READING/LITERATURE EVIDENCE-BASED SELECTED-RESPONSE ITEMS

There were no evidence-based selected-response items in the reading content area field tested during the 20192020 school year. Classical item statistics for all items field tested prior to 2018-2019 can be found in Appendix B of the 2017-2018 technical report. Classical item statistics for items field tested in 2018-2019 can be found in Appendix B of the 2018-2019 technical report.

## SCIENCE TECHNOLOGY-ENCHANCED ITEMS

Table B-1. Technology-Enhanced Item Statistics

| Column Heading | Definition |
| :--- | :--- |
| ID | Item ID |
| Grade | Item grade or course alignment |
| Max Points | Maximum possible item score |
| $N$ | Number of students |
| PVal | Item mean score/Maximum possible item score |
| P( ) | Proportion gaining given point (- = blank) |
| PtBis | Point biserial (item-total correlation) |
| PT( ) | Point biserial of given score point |
| Meas | Rasch item difficulty measure estimate |
| MSE | Standard error of Rasch item difficulty measure estimate |
| Z-in | Z-standardized infit statistic |
| MS-in | Mean square infit statistic |
| Z-out | Z-standardized outfit statistic |
| MS-out | Mean square outfit statistic |
| M/F | Male/female DIF statistic |
| W/B | White/black DIF statistic |
| W/H | White/Hispanic DIF statistic |

Table B-2. Science Technology-Enhanced Item Statistics

## APPENDIX C: VERTICAL LINKING ITEM DETAILS

This appendix provides details on the items used to build the vertical scales in each content area. Information such as grade, n -count, eligible content code, and diagnostic category is provided for each of the vertical linking items. This information is based on the academic standards in place at the time each of the content area vertical scale was established ${ }^{1}$. Summary tables indicate the number of linking items in each diagnostic category. A sample of the vertical linking Excel file is provided as well as plots of the vertical linking items.

## MATHEMATICS

Tables C-1 through C-8 show n-counts, eligible content code, and diagnostic category for each of the vertical linking items.

Each item was administered in two grades so there are two n-counts: one for the lower grade and one for the upper grade. For example, item 600869 is a grade 3 item used to link grades 3 and 4. It was administered 1,280 times on the lower grade forms (grade 3) and 964 times on the upper grade forms (grade 4).

Diagnostic categories for Algebra I, Geometry, and Algebra II are different than diagnostic categories for grades 3 through 8 and 11 Mathematics. Items may fall into both a Mathematics diagnostic category and an Algebra I, Geometry, or Algebra II diagnostic category. This is shown in Tables C-6, C-7, and C-8. For example, item 601329 is in the Mathematics diagnostic category "Geometry" and the Geometry diagnostic category "Coordinate Geometry and Right Triangles".

The Mathematics diagnostic categories are ${ }^{2}$ :

- Numbers and Operations
- Measurement
- Geometry
- Algebraic Concepts
- Data Analysis and Probability

The Algebra I diagnostic categories are:

- Operations with Real Numbers and Expressions
- Linear Equations \& Inequalities
- Functions \& Coordinate Geometry
- Data Analysis

The Geometry diagnostic categories are:

- Geometric Properties
- Congruence, Similarity, \& Proofs
- Coordinate Geometry and Right Triangles
- Measurement

The Algebra II diagnostic categories are:

- Operations with Complex Numbers
- Non-linear Expressions \& Equations
- Functions
- Data Analysis

Tables C-9 through C-16 summarize the number of linking items by diagnostic category. Items coded in a Mathematics diagnostic category and an Algebra I, Geometry, or Algebra II diagnostic category are noted.

Table C-9. Number of Items Linking Grade 3 to Grade 4 by Diagnostic Category

| Diagnostic Gategory | Grade 3 Items | Grade 4 Items | Total |
| :---: | :---: | :---: | :---: |
| Numbers \& Operations | 8 | 6 | 14 |
| Measurement | 5 | 4 | 9 |
| Geometry | 2 | 4 | 6 |
| Algebraic Concepts | 3 | 3 | 6 |
| Data Analysis \& Probability | 2 | 3 | 5 |
| TOTAL | 20 | 20 | 40 |

Table C-10. Number of Items Linking Grade 4 to Grade 5 by Diagnostic Category

| Diagnostic Category | Grade 4 Items |  | Grade 5 Items |
| :--- | ---: | ---: | ---: |
| Numbers \& Operations | 6 | 7 | Total |
| Measurement | 3 | 4 | 13 |
| Geometry | 4 | 3 | 7 |
| Algebraic Concepts | 3 | 3 | 7 |
| Data Analysis \& Probability | 4 | 3 | 6 |
| TOTAL | 20 | 20 | 7 |

Table C-11. Number of Items Linking Grade 5 to Grade 6 by Diagnostic Category

| Diagnostic Category | Grade 5 Items | Grade 6 Items | Total |
| :--- | ---: | ---: | ---: |
| Numbers \& Operations | 10 | 4 | 14 |
| Measurement | 6 | 4 | 10 |
| Geometry | 5 | 3 | 8 |
| Algebraic Concepts | 4 | 4 | 8 |
| Data Analysis \& Probability | 5 | 5 | 10 |
| TOTAL | 30 | 20 | 50 |

Table C-12. Number of Items Linking Grade 6 to Grade 7 by Diagnostic Category

| Diagnostic Gategory | Grade 6 Items |  | Grade 7 Items |
| :--- | ---: | ---: | ---: |
| Numbers \& Operations | 8 | 8 | Total |
| Measurement | 5 | 4 | 16 |
| Geometry | 6 | 4 | 9 |
| Algebraic Concepts | 5 | 8 | 10 |
| Data Analysis \& Probability | 6 | 6 | 13 |
| TOTAL | 30 | 30 | 12 |

Table C-13. Number of Items Linking Grade 8 to Grade 7 by Diagnostic Category

| Diagnostic Category | Grade 7 Items |  | Grade 8 Items |
| :--- | ---: | ---: | ---: |
| Numbers \& Operations | 9 | 7 | Total |
| Measurement | 4 | 5 | 16 |

## READING/LITERATURE

Tables C-18 through C-23 show n-counts, eligible content code, and diagnostic category for each of the vertical linking items.

Each item was administered in two grades so there are two $n$-counts: one for the lower grade and one for the upper grade. For example, item 613607 is a grade 3 item used to link grades 3 and 4 . It was administered 761 times on the lower grade form (grade 3) and 826 times on the upper grade form (grade 4). In some cases, a linking item was also a common item. This results in n -count that is much higher in one of the two grades. For example, item 613400 is a grade 4 item used to link grades 3 and 4 . It was also a common grade 4 item (meaning it appeared on all grade 4 forms). The $n$-counts reflect this: Grade $3 n$-count is 754 while grade $4 n$-count is 6,574 .

The diagnostic categories are ${ }^{3}$

- Comprehension
- Vocabulary
- Interpretation/Analysis Literary Elements \& Devices
- Interpretation/Analysis Persuasive Techniques
- Interpretation/Analysis Organizational Skills

| 612496 | Lit | Literature to Grade 8 | 497 | 258 | L.F.1.1.1 | Comprehension |

Tables C-24 through C-29 summarize the number of linking items by diagnostic category.
Vertical linking items are not distributed evenly across the diagnostic categories. This is due to the fact that Reading and Literature items are passage based. The three passage types (literary, persuasive, and organizational) may each have associated comprehension and vocabulary items, as well as interpretation/analysis items.

Table C-24. Number of Items Linking Grade 3 to Grade 4 by Diagnostic Category

| Diagnostic Gategory | Grade 3 Items |  | Grade 4 Items |
| :--- | ---: | ---: | ---: |
| Comprehension | 8 | 6 | Total |
| Vocabulary | 9 | 7 | 14 |
| I/A Literary | 3 | 3 | 16 |
| I/A Persuasive | 0 | 2 | 6 |
| I/A Organizational | 0 | 2 | 2 |
| TOTAL | 20 | 20 | 2 |

Table C-25. Number of Items Linking Grade 4 to Grade 5 by Diagnostic Category

| Diagnostic Category | Grade 4 Items |  | Grade 5 Items |
| :--- | ---: | ---: | ---: |
| Comprehension | 6 | 6 | Total |
| Vocabulary | 8 | 4 | 12 |

## SCIENCE

Tables C-31 through C-37 show n-counts, eligible content code, and diagnostic category for each of the vertical linking items.

Each item was administered in two grades so there are two $n$-counts: one for the lower grade and one for the upper grade. For example, item 615315 is a grade 3 item used to link grades 3 and 4 . It was administered 789 times on the lower grade form (grade 3) and 530 times on the upper grade form (grade 4). In some cases, a linking item was also a common item. This results in n -count that is much higher in one of the two grades. For example, item 617401 is a Biology item used to link Biology and grade 8. It was also a common Biology item (meaning it appeared on all Biology forms). The $n$-counts reflect this: Grade 8 n -count is 256 while Biology $n$-count is 4,874 .

Diagnostic categories for Biology and Chemistry are different than diagnostic categories for grades 3 through 8 and 11 Science. Items may fall into both a Science diagnostic category and a Biology or Chemistry diagnostic category. This is shown in Tables C-36 and C-37. For example, item 615777 is in the Science diagnostic category "Biological Sciences" and the Biology diagnostic category "Basic Biological Principles".

The Science diagnostic categories are:

- The Nature of Science
- Biological Science
- Physical Sciences
- Earth and Space Sciences

The Biology diagnostic categories are:

- Basic Biological Principles/Chemical Basis for Life
- Bioenergetics/Homeostasis and Transport
- Cell Growth and Reproduction/Genetics
- Theory of Evolution/Ecology

The Chemistry diagnostic categories are:

- Properties and Classification of Matter
- Atomic Structure and the Periodic Table
- The Mole and Chemical Bonding
- Chemical Relationships and Reactions

Table C-31. Science Items Used to Link Grade 3 to Grade 4

Tables C-38 through C-44 summarize the number of linking items by diagnostic category. Items coded in a Science diagnostic category and a Biology or Chemistry diagnostic category are noted.

Table C-38. Number of Items Linking Grade 3 to Grade 4 by Diagnostic Category

| Diagnostic Category | Grade 3 Items |  | Grade 4 Items |
| :--- | ---: | ---: | ---: |
| Nature of Science | 6 | 6 | Total |
| Biological Sciences | 7 | 6 | 12 |
| Physical Sciences | 2 | 3 | 13 |
| Earth and Space Sciences | 5 | 5 | 5 |
| TOTAL | 20 | 20 | 10 |

Table C-39. Number of Items Linking Grade 4 to Grade 5 by Diagnostic Category

| Diagnostic Category | Grade 4 Items | Grade 5 Items | Total |
| :---: | :---: | :---: | :---: |
| Nature of Science | 7 | 7 | 14 |
| Biological Sciences | 4 | 5 | 9 |
| Physical Sciences | 4 | 4 | 8 |
| Earth and Space Sciences | 5 | 4 | 9 |
| TOTAL | 20 | 20 | 40 |

Table C-40. Number of Items Linking Grade 5 to Grade 6 by Diagnostic Category

| Diagnostic Category | Grade 5 Items | Grade 6 Items | Total |
| :---: | :---: | :---: | :---: |
| Nature of Science | 5 | 6 | 11 |
| Biological Sciences | 5 | 5 | 10 |
| Physical Sciences | 7 | 5 | 12 |
| Earth and Space Sciences | 3 | 4 | 7 |
| TOTAL | 20 | 20 | 40 |

Table C-41. Number of Items Linking Grade 6 to Grade 7 by Diagnostic Category

| Diagnostic Gategory | Grade 6 Items | Grade 7 Items | Total |
| :---: | :---: | :---: | :---: |
| Nature of Science | 7 | 7 | 14 |
| Biological Sciences | 3 | 5 | 8 |
| Physical Sciences | 8 | 4 | 12 |
| Earth and Space Sciences | 2 | 4 | 6 |
| TOTAL | 20 | 20 | 40 |

Table C-42. Number of Items Linking Grade 8 to Grade 7 by Diagnostic Category

| Diagnostic Category | Grade 7 Items |  | Grade 8 Items |
| :--- | ---: | ---: | ---: |
| Nature of Science | 6 | 6 | Total |
| Biological Sciences | 5 | 5 | 12 |
| Physical Sciences | 4 | 4 | 10 |
| Earth and Space Sciences | 5 | 5 | 8 |
| TOTAL | 20 | 20 | 10 |

Table C-43a. Number of Items Linking Biology to Grade 8 by Diagnostic Category

| Diagnostic Gategory | Grade 8 Items | Biology Items | Total |
| :--- | ---: | ---: | ---: |
| Nature of Science | 6 | 0 | 6 |
| Biological Sciences | 10 | 20 | 30 |
| Physical Sciences | 2 | 0 | 2 |
| Earth and Space Sciences | 2 | 0 | 2 |
| No Grade 8 DC | 0 | 0 | 0 |
| TOTAL | 20 | 20 | 40 |

Table C-43b. Number of Items Linking Biology to Grade 8 by Diagnostic Category

| Diagnostic Gategory | Grade 8 Items |  | Biology Items |
| :--- | ---: | ---: | ---: |
| Basic Biological Principles | 2 | 3 | Total |
| Bioenergetics | 0 | 3 | 5 |
| Cell Growth | 4 | 5 | 3 |
| Theory of Evolution | 7 | 9 | 9 |
| No Biology DC | 7 | 0 | 16 |
| TOTAL | 20 | 20 | 7 |

Table C-44a. Number of Items Linking Chemistry to Grade 8 by Diagnostic Category

| Diagnostic Category | Grade 8 Items |  | Chemistry Items |
| :--- | ---: | ---: | ---: |
| Nature of Science | 9 | 0 | Total |
| Biological Sciences | 2 | 0 | 9 |
| Physical Sciences | 7 | 20 | 2 |
| Earth and Space Sciences | 2 | 0 | 27 |
| No Grade 8 DC | 0 | 0 | 2 |
| TOTAL | 20 | 20 | 0 |

Table C-44b. Number of Items Linking Chemistry to Grade 8 by Diagnostic Category

| Diagnostic Category | Grade 8 Items |  | Chemistry Items |
| :--- | ---: | ---: | ---: |
| Properties of Matter | 1 | 7 | Total |
| Atomic Structure | 0 | 3 | 8 |
| The Mole | 2 | 3 | 3 |
| Chemical Relationships | 1 | 7 | 5 |
| No Chemistry DC | 16 | 0 | 8 |
| TOTAL | 20 | 20 | 16 |

## WRITING/ENGLISH COMPOSITION

Tables C-46 through C-51 show n-counts, eligible content code, and diagnostic category for each of the vertical linking items.

Each item was administered in two grades so there are two n-counts: one for the lower grade and one for the upper grade. For example, item 626547 is a grade 3 item used to link grades 3 and 4. It was administered 274 times on the lower grade form (grade 3) and 234 times on the upper grade form (grade 4).

The diagnostic categories are ${ }^{4}$ :

- Quality of Writing: Focus and Content
- Quality of Writing: Organization and Style
- Quality of Writing: Editing
- Conventions: Spelling, Capitalization, and Punctuation
- Conventions: Grammar and Sentence Formation

Tables C-52 through C-57 summarize the number of linking items by diagnostic category.
Table C-52. Number of Items Linking Grade 3 to Grade 4 by Diagnostic Category

| Diagnostic Gategory | Grade 3 Items |  | Grade 4 Items |
| :--- | ---: | ---: | ---: |
| Focus and Content | 4 | 4 | Total |
| Org and Style | 4 | 5 | 8 |
| Editing | 0 | 3 | 9 |
| Spell., Cap., Punct. | 6 | 6 | 3 |
| Gram. and Sent. | 6 | 2 | 12 |
| TOTAL | 20 | 20 | 8 |

Table C-53. Number of Items Linking Grade 4 to Grade 5 by Diagnostic Category

| Diagnostic Category | Grade 4 Items |  | Grade 5 Items |
| :--- | ---: | ---: | ---: |
| Focus and Content | 4 | 0 | Total |
| Org and Style | 4 | 7 | 4 |
| Editing | 4 | 2 | 11 |
| Spell., Cap., Punct. | 6 | 6 | 6 |
| Gram. and Sent. | 2 | 5 | 12 |
| TOTAL | 20 | 20 | 7 |

Table C-54. Number of Items Linking Grade 5 to Grade 6 by Diagnostic Category

| Diagnostic Category | Grade 5 Items |  | Grade 6 Items |
| :--- | ---: | ---: | ---: |
| Focus and Content | 2 | 4 | Total |
| Org and Style | 2 | 4 | 6 |
| Editing | 6 | 2 | 6 |
| Spell., Cap., Punct. | 6 | 6 | 8 |
| Gram. and Sent. | 4 | 4 | 12 |
| TOTAL | 20 | 20 | 8 |

Table C-55. Number of Items Linking Grade 6 to Grade 7 by Diagnostic Category

| Diagnostic Category | Grade 6 Items | Grade 7 Items | Total |
| :--- | ---: | ---: | ---: |
| Focus and Content | 2 | 4 | 6 |
| Org and Style | 2 | 4 | 6 |
| Editing | 4 | 0 | 4 |
| Spell., Cap., Punct. | 6 | 6 | 12 |
| Gram. and Sent. | 6 | 6 | 12 |
| TOTAL | 20 | 20 | 40 |

Table C-56. Number of Items Linking Grade 8 to Grade 7 by Diagnostic Category

| Diagnostic Gategory | Grade 7 Items |  | Grade 8 Items |
| :--- | ---: | ---: | ---: |
| Focus and Content | 4 | 6 | Total |
| Org and Style | 4 | 2 | 10 |
| Editing | 1 | 0 | 6 |
| Spell., Cap., Punct. | 6 | 6 | 1 |
| Gram. and Sent. | 5 | 6 | 12 |
| TOTAL | 20 | 20 | 11 |

Table C-57. Number of Items Linking English Composition to Grade 8 by Diagnostic Category

| Diagnostic Gategory | Grade 8 Items |  | Eng Comp Items |
| :--- | ---: | ---: | ---: |
| Focus and Content | 2 | 4 | Total |
| Org and Style | 4 | 4 | 6 |
| Editing | 2 | 0 | 8 |
| Spell., Cap., Punct. | 6 | 6 | 2 |
| Gram. and Sent. | 6 | 6 | 12 |
| TOTAL | 20 | 20 | 12 |

Figure C-27. CDT Writing/English Composition: Literature to Grade 8 Linking - All Links

## APPENDIX D: SIGNIFICANT DIFFERENCES AMONG DIAGNOSTIC CATEGORIES

In Chapter Fifteen (Operational Administration 2019-2020), significant differences among diagnostic categories were tested with a t-test using a Bonferroni correction for multiple comparisons to keep the familywise Type I error rate at 0.32 . The tables in this appendix show the significant differences with the familywise Type I error rate at 0.10.

## DIAGNOSTIC CATEGORY SIGNIFICANT DIFFERENCES

Table D-1a. Diagnostic Category Significant Differences - Math Grades 3-5

| Group 1 | Group 2 | Yes | No | \% Yes | \% No |
| :---: | :---: | :---: | :---: | :---: | :---: |
| DC1 | DC2 | 640 | 133,009 | 0.5\% | 99.5\% |
| DC1 | DC3 | 1,155 | 132,494 | 0.9\% | 99.1\% |
| DC1 | DC4 | 643 | 133,006 | 0.5\% | 99.5\% |
| DC2 | DC3 | 1,326 | 132,323 | 1.0\% | 99.0\% |
| DC2 | DC4 | 689 | 132,960 | 0.5\% | 99.5\% |
| DC3 | DC4 | 1,108 | 132,541 | 0.8\% | 99.2\% |

Note: $Z$ value is 2.39

Table D-1b. Total Number of Diagnostic Category Significant Differences - Math Grades 3-5

| Number of Significant <br> Differences | Number of <br> Students | Percent of <br> Students |
| :--- | ---: | ---: |
| 0 | 129,394 | $96.8 \%$ |

## APPENDIX E: DECISION CONSISTENCY

In Chapter Sixteen (Reliability), decision consistency for each CDT test and benchmark cut is reported with two values: exact agreement rate and kappa. However, as noted in the chapter, retest classification probability varies at different points along the scale. For example, the retest probability of green is higher for scores near the red/green cut than for scores very low in the red range. This appendix provides a more detailed examination of the differences in retest probability across the score range. $3 \times 3$ retest classification probability tables and retest classification percent tables by score range are presented for all CDT tests and benchmark cuts.

## 3 X 3 RETEST CLASSIFICATION PROBABILITY

Table E-1. Retest Classification Probability - Mathematics Grade 3

|  | Red - retest | Green - retest | Blue - retest |
| :--- | ---: | ---: | ---: |
| Red - test | 0.951 | 0.049 | 0.000 |
| Green - test | 0.156 | 0.806 | 0.038 |

N -count $=7,203$

## Retest Classification Percent for Various Scale Score Ranges

Tables E-34 through E-66 show the percent chance of scoring in each color range if retested without additional instruction for various scale scores ranges.

Table E-34. Retest Classification Percent for Various Scale Score Ranges - Mathematics Grade 3

| Scale Score Range | Number of Students | Red (\% Chance in Gategory if Retested*) | Green (\% Chance in Category if Retested*) | Blue (\% Chance in Gategory if Retested*) | \% Chance in Same Gategory if Retested* |
| :---: | :---: | :---: | :---: | :---: | :---: |
| < 200 | 0 | N/A | N/A | N/A | N/A |
| 200 to 249 | 25 | >99.9\% | 0.0\% | 0.0\% | >99.9\% |
| 250 to 299 | 76 | >99.9\% | 0.0\% | 0.0\% | >99.9\% |
| 300 to 349 | 305 | >99.9\% | 0.0\% | 0.0\% | >99.9\% |
| 350 to 399 | 827 | >99.9\% | 0.0\% | 0.0\% | >99.9\% |
| 400 to 449 | 1,332 | >99.9\% | 0.0\% | 0.0\% | >99.9\% |
| 450 to 499 | 1,946 | >99.9\% | 0.0\% | 0.0\% | >99.9\% |
| 500 to 549 | 2,629 | >99.9\% | 0.0\% | 0.0\% | >99.9\% |
| 550 to 599 | 3,352 | >99.9\% | 0.0\% | 0.0\% | >99.9\% |

## APPENDIX F: CDT LEARNING PROGRESSIONS

The CDT learning progressions were developed by the Pennsylvania Department of Education (PDE) and its curriculum consultants, including staff from Data Recognition Corporation (DRC), to show the developmental sequences or building blocks of content/skills students need to master as they progress toward career and college readiness. The progressions were developed for each content area (i.e., English language arts, mathematics, and science.) They served and continue to serve as roadmaps or the pathways (K-12) that students travel as they progress toward mastery of the skills needed for career and college readiness. As such, each learning progression was developed to provide teachers with the opportunity to determine whether students have navigated successfully through the building blocks and are able to move forward along the road to career and college readiness for a given content area. Each progression also provides teachers with the opportunity to identify students who may need additional instruction in a given content area, as well as to identify students who have navigated successfully beyond the building blocks or mileposts for each grade and/or course and are in need of accelerated curriculum. The learning progressions are directly aligned and based upon the Pennsylvania Academic Standards, the Assessment Anchors, and the Eligible Contents and as such provide evidence of the linkage between the CDT and the Pennsylvania PSSA and Keystone assessments addressing career and college readiness success with interpretations.

The learning progressions were first developed in 2009. Upon the initial development of the learning progression, the progressions were reviewed by Pennsylvania educators to confirm alignment to the Pennsylvania Standards and to confirm that the progressions, do, in fact, serve to show the development sequences of content/skills students need to master as they progress toward career and college readiness. At this meeting with educators, PDE and DRC provided information about the development of the learning progressions, the purpose of the progressions, and the actual progressions for each content area. The committees of Pennsylvania educators reviewed the progressions, which serve to show the vertical articulation of the Pennsylvania Academic Standards, Assessment Anchors and Eligible Content across grades within a given subject area (e.g., reading, mathematics). Pennsylvania educators were asked to confirm that the progressions were an accurate representation of how the content/skills included in the Pennsylvania Academic Standards progressed across grades and provided a broad description of the essential content and general sequencing for student learning and skill development as each student progresses toward college and career readiness.

Beginning 2010, the learning progressions have continued to be used during item reviews for the CDT, as well as for the PSSA and the Keystone assessments. For example, during each subsequent review of items for potential use on these assessments, including the CDT, Pennsylvania educators, in addition to reviewing items for alignment to the standards, cognitive complexity, technical quality, etc. also review items for alignment to the learning progressions. The learning progressions are included in this evidence to demonstrate the content/skills linkage between the CDT to address career and college readiness success.

# APPENDIX G: DEVELOPMENT OF THE PENNSYLVANIA ACADEMIC STANDARDS, ASSESSMENT ANCHOR CONTENT STANDARDS, AND ELIGIBLE CONTENT 

The Assessment Anchor Content Standards and Eligible Content statements are based on the Pennsylvania Academic Standards in English language arts and mathematics and the Pennsylvania Academic Standards in science. Although the Academic Standards indicated in broad terms what students should know and be able to do, educator concerns regarding the number and breadth of the Academic Standards led to an initiative by the Pennsylvania Department of Education (PDE) to develop Assessment Anchor Content Standards to indicate which parts of the Academic Standards (Instructional Content Standards) would be assessed on the summative assessments. Based on recommendations from Pennsylvania educators, the Assessment Anchor Content Standards were designed to improve the articulation of curricular, instructional, and assessment practices. The anchors clarify what is expected across each grade and content area and focus the content of the standards into what is assessable on a large-scale test. The Assessment Anchor Content Standards also serve to communicate Eligible Content or assessment limits. The Eligible Content statements also provide for the range of knowledge and skills from which the summative assessments and the CDT is designed.

The Assessment Anchor Content Standards' structure includes the content, grade level, Reporting Category, Assessment Anchor, descriptor (Sub-Assessment Anchor), and Eligible Content. Each of the Assessment Anchor Content Standards has one or more descriptors (Sub-Assessment Anchors) and Eligible Content to reflect gradelevel appropriateness. The Assessment Anchor Content Standards form the basis of the test design. In turn, this hierarchy is the basis for organizing the total content scores (based on the core [common] sections). The Assessment Anchor Content Standards, therefore, are the general descriptions of what students should know and be able to do. The Eligible Content statements are the more specific statements of the knowledge and/or skills that students are expected to demonstrate in a given grade and content area. The Eligible Content statements are considered the granular level to which items are written. As such, they serve to define at a more granular level what students should know and be able to do. They also serve as the checkpoints that monitor progress toward meeting the board Pennsylvania Academic Standards. In other states' structures of content standards, the Assessment Anchor Content Standards are often labeled Benchmarks, and the Eligible Content statements are often labeled grade-level expectations.

The complete set of Assessment Anchor Content Standards and Eligible Content statements aligned to the board Pennsylvania Academic Standards can be found at the PDE's website: www.education.pa.gov.

## DEVELOPMENT OF THE ASSESSMENT ANCHOR CONTENT STANDARDS AND THE ELIGIBLE CONTENT STATEMENTS

With Pennsylvania's decision to adopt the Pennsylvania Academic Standards in July 2010, committees of Pennsylvania educators then met in October 3-6, 2011 to write and review the Assessment Anchor Content Standards and Eligible Content statements aligned to the new Pennsylvania Academic Standards. Members of the committees included representatives from the PDE curriculum and instruction, the PDE assessment, Pennsylvania educators, and a team of expert consultants appointed by the PDE. The consultants were Pennsylvania known and nationally known experts representing specific areas of expertise. These appointed consultants were members of the Pennsylvania Quality Review Team, and their function was to oversee the process, ensuring quality throughout.

Prior to the beginning of the development of the Assessment Anchor Content Standards and the Eligible Content statements, the PDE-selected Quality Review Team consultants and the PDE assessment and curriculum staff analyzed pertinent national career- and college-ready standards and curriculum framework documents including frameworks from the National Assessment of Educational Progress (NAEP). Once the analysis was completed, members of the PDE-selected Quality Review Team met with the testing vendor, Data Recognition Corporation (DRC) to provide recommendations as to what materials and documents would be needed to facilitate the committees of Pennsylvania educators in the development and review of the Assessment Anchor Content Standards and the Eligible Content statements. In addition, the purpose of this meeting with the Quality Review Team was to come to agreement on the Assessment Anchor Content Standards and Eligible Content development process, including the role of the Pennsylvania educators, the PDE assessment staff, the PDE curriculum staff, the Quality Review Team members, and the testing vendor, DRC.

To provide initial focus at the October 2011 meetings, each content and grade committee of Pennsylvania educators was presented with materials specific to the content and grade to which the anchors and Eligible Content statements were to be developed, including a basic blueprint structure of the summative assessment and the CDT. The Pennsylvania Academic Standards, the 2005 version of the Pennsylvania Assessment Anchor Content Standards and Eligible Content aligned to the previous Pennsylvania Academic Standards, other careerand college-ready state standards, and draft Eligible Content statements aligned to the newly revised Pennsylvania Academic Standards were also provided. Committees then completed an iterative process of developing, reviewing, and revising the Assessment Anchor Content Standards and Eligible Content statements followed by discussions across grade-level committees to ensure vertical articulation across the grades. The results from the committee work were recorded and eventually evaluated by national, state, and local subject experts as noted in the sections below.

To begin the process, a general training session was held for all meeting participants. The training included welcome remarks, setting of the context for the task by the PDE staff and the PDE Quality Review Team member staff, and a presentation of the procedural training and meeting logistics by the testing vendor, DRC. Each meeting began with an introduction to Pennsylvania's Standards Aligned System and an overview of the assessment program. The PDE staff and the PDE Quality Review Team members articulated Pennsylvania's vision for the content standards, including the role that the Assessment Anchor Content Standards and Eligible Content statements would play in defining what students should know and be able to do. The opening presentation also included providing educators with the definition, structure, and purpose of the content standards, including definitions of Assessment Anchor Content Standards and Eligible Content statements. Training was also provided concerning writing, reviewing, and revising the Assessment Anchor Content Standards and Eligible Content statements. The focus of the training was to follow the design parameters to include clear, focused, rigorous, manageable, and subject-area statements.

The following materials were provided at the meeting:

- Pennsylvania Curriculum Framework: The Curriculum Framework specifies what is to be taught for each subject in the curriculum. In Pennsylvania, Curriculum Frameworks include Big Ideas, Concepts, Competencies, and Essential Questions aligned to standards. They are defined as follows:

Big Ideas: The big ideas are the declarative statements that describe concepts that transcend grade levels. Big Ideas are essential to provide focus on specific content for all students.

Concepts: The concepts are what students should know (key knowledge) as a result of this instruction specific to grade level.

Competencies: The competences are what students should be able to do (key skills) as a result of this instruction, specific to grade level.

Essential Questions: The essential questions are connected to the Standards Aligned System (SAS) framework and are specifically linked to the big ideas. They frame student inquiry, promote critical thinking, and assist in learning transfer.

- Pennsylvania Academic Standards
- Other documents as relevant, including hard copy working documents with adequate white space

After the training, committee members were instructed to begin the development process. Committee members were provided with hard copy working documents. Using their background knowledge and the materials they were provided during the meeting (e.g., documents from the Standards Aligned System, curriculum framework, Pennsylvania's Academic Standards), Pennsylvania educators created their own short list of the critical concepts that Pennsylvania students must know and be able to do for each grade and content area. Beginning with one concept at a time, concepts or Eligible Content statements were recorded on the master list; Assessment Anchor Content Standards were then developed and reviewed. As the Assessment Anchor Content Standards and Eligible Content statements were developed, they were displayed using a laptop and projector. A scribe from the testing vendor, DRC, served to record the committee members' work as well as other comments. The scribe also recorded changes or additions to the anchors and/or statements as directed from the consensus of the group.

Next, the entire group reviewed and discussed the recommendations for the anchors and the Eligible Content statements. Consensus was reached. The committee of Pennsylvania educators proceeded in this manner until all Assessment Anchor Content Standards and Eligible Content statements for each grade and content area were developed, reviewed, and discussed. DRC's facilitator took notes verbatim regarding the intent and direction of the committee. The notes were prepared for use in subsequent meetings.

## FOLLOW-UP MEETINGS WITH THE QUALITY REVIEW TEAM AND PDE

A series of follow-up meetings took place with the PDE-appointed team of consultants, PDE assessment staff, and PDE-appointed Quality Review Team members. Prior to the follow-up meetings, a draft of the Assessment Anchor Content Standards and Eligible Content statements for each grade and content area were prepared for review, including all notes from the meeting with Pennsylvania educators. During the follow-up meetings, the Assessment Anchor Content Standards and Eligible Content statements were reviewed, and revisions were suggested. After the follow-up meetings, the Assessment Anchor Content Standards and Eligible Content statements were revised by the PDE and the PDE Quality Review Team per agreed-upon feedback. This revised draft was then posted on the Pennsylvania System of Aligned Standards (SAS) website for public review and opinion. All additional feedback from the public review was reviewed again by the PDE and the PDE-appointed Quality Review Team and agreed upon revisions to the Assessment Anchor Content Standards and Eligible Content statements were made. The Assessment Anchor Content Standards and Eligible Content statements were then finalized and prepared for the Pennsylvania Board of Education for approval as the official Pennsylvania Academic Content Standards.

## PENNSYLVANIA BOARD OF EDUCATION APPROVAL

The Assessment Anchor Content Standards and Eligible Content statements were presented to the State Board of Education in September 2013. They were subsequently approved by the State Board at the September 2013 State Board meeting as Pennsylvania Content Standards.

## APPENDIX H: CDT PASSAGE DEVELOPMENT PROCESS

The task of writing passages or securing passages and or other stimuli for the CDT is conducted by Data Recognition Corporation (DRC) professionals with classroom experience in reading/language arts as well as experience writing the various types of passages and/or stimuli required by the CDT and the Pennsylvania Academic Standards, Assessment Anchors, and Eligible Content. Guidelines provided to writers for passage/ stimulus writing for the CDT include appropriate length, text structure, density, and vocabulary for the grade level as reviewed and approved by the Pennsylvania Department of Education (PDE) and as aligned to the Pennsylvania Academic Standards, Assessment Anchors, and Eligible Content. Passage/stimulus writers are given a specified number of passages/stimuli to write for each genre/standard per grade. Passage/stimulus training includes training writers to develop passages/stimuli to meet the following requirements:

- Grade appropriateness
- Appropriate readability for the assigned grade
- Interest value for students
- Freedom from bias, fairness, and sensitivity issues
- Representation of different cultures
- Ability to generate a variety of item types
- Avoidance of dated subject matter, unless a relevant historical context is provided
- No need for extensive background knowledge in a certain discipline or subject area

While DRC does train passage writers to be knowledgeable of each passage's readability, for the CDT we also statistically analyze readability of each passage, using Lexile, Flesch-Kincaid, Powers, and Spache measurements. The process that DRC's item and test development team uses to determine text complexity involves (1) the quantitative evaluation of the text, and (2) the qualitative evaluation of the text. This analysis is documented on a passage placemat. (See example passage placemat at the end of this section.) A third component, matching reader to text and task, is also taken into consideration during passage evaluation and internal reviews.

## QUANTITATIVE EVALUATION

Evaluating the complexity of a passage is a judgment process conducted by DRC passage writers and internal reviewers who are familiar with the classroom context and what is developmentally and linguistically appropriate for students at a given grade level. DRC uses common readability formulas along with the qualitative information when selecting passages during development.

## QUALITATIVE EVALUATION

For programs such as the CDT, DRC also implements qualitative measures to help determine placement and appropriateness of passages. These measures include rubric-based qualitative evaluations and external reviewers to provide expert opinions on grade-level appropriateness, as part of considerations for matching the reader to text and task. Rubrics provide the qualitative measures for literary and informational passages. As indicated on the placemats, the quantitative rubrics suggest the appropriate grade band of the passage, while the qualitative rubrics help to further clarify the specific grade level of the passage. These rubrics provide a powerful and comprehensive way of evaluating a range of stimulus materials that cover the literary and informational scope outlined in the client state's standards.

## TEXT COMPLEXITY: QUALITATIVE-MEASURES RUBRIC—LITERARY TEXTS

The English Language Arts State Collaborative on Assessment and Student Standards (SCASS) developed the following qualitative-measures rubric for determining the text complexity of literary passages. The rubric examines criteria judged as central to students' successful comprehension of text meaning, text structure, language features, and knowledge demands. Each of these categories is ranked based on descriptors associated with the following levels: slightly complex, moderately complex, very complex, and exceedingly complex.

## Qualitative-Measures Rubric-Literary Passages

| Features | Exceedingly Complex | Very Complex | Moderately Complex | Slightly Complex |
| :---: | :---: | :---: | :---: | :---: |
| Meaning | Several levels and competing elements of meaning that are difficult to identify, separate, and interpret; theme is implicit or subtle, often ambiguous and revealed over the entirety of the text | Several levels of meaning that may be difficult to identify or separate; theme is implicit or subtle and may be revealed over the entirety of the text | More than one level of meaning with levels clearly distinguished from each other; theme is clear but may be conveyed with some subtlety | One level of meaning; theme is obvious and revealed early in the text |
| Organization | Organization is intricate with regard to elements such as narrative viewpoint, time shifts, multiple characters, storylines, and detail | Organization may include subplots, time shifts, and more complex characters | Organization may have two or more storylines and is occasionally difficult to predict | Organization of text is clear, chronological, or easy to predict |
| Use of images | If used, minimal illustrations that support the text | If used, a few illustrations that support the text | If used, a range of illustrations that support selected parts of the text | If used, extensive illustrations that directly support and assist in interpreting the written text |
| Language Features | Conventionality | Conventionality | Conventionality | Conventionality |
|  | Dense and complex; contains abstract, ironic, and/or figurative language | Complex; contains some abstract, ironic, and/or figurative language | Largely explicit and easy to understand, with some occasions for more complexmeaning | Explicit, literal, straightforward, easy to understand |
|  | Vocabulary | Vocabulary | Vocabulary | Vocabulary |
|  | Generally unfamiliar, archaic, subject- specific, or overly academic language; may be ambiguous or purposefully misleading | Somewhat complex language that is sometimes unfamiliar, archaic, subject- specific, or overly academic | Mostly contemporary, familiar, conversational; rarely unfamiliar or overly academic | Contemporary, familiar, conversational language |
|  | Sentence Structure | Sentence Structure | Sentence Structure | Sentence Structure |
|  | Mainly complex sentences, often containing multiple concepts | Many complex sentences with several subordinate phrases or clauses and transition words | Simple and compound sentences, with some more complex constructions | Mainly simple sentences |
| Knowledge Demands | Life Experiences | Life Experiences | Life Experiences | Life Experiences |
|  | Explores complex, sophisticated themes; experiences are distinctly different from those of the common reader | Explores themes of varying levels of complexity; experiences portrayed are uncommon to most readers | Explores a single theme; experiences portrayed are common to many readers | Explores a single theme; experiences portrayed are everyday and common to most readers |
|  | Intertextuality and Cultural Knowledge | Intertextuality and Cultural Knowledge | Intertextuality and Cultural Knowledge | Intertextuality and Cultural Knowledge |
|  | Many references or allusions to other texts or cultural elements | Some references or allusions to other texts or cultural elements | A few references or allusions to other texts or cultural elements | No references or allusions to other texts or cultural elements |

Qualitative-Measures Rubric-Informational Texts

| Features | Exceedingly Complex | Very Complex | Moderately Complex | Slightly Complex |
| :---: | :---: | :---: | :---: | :---: |
| Purpose | Purpose <br> Subtle, implied, difficult to determine; intricate, theoretical elements | Purpose <br> Implied but fairly easy to infer; more theoretical than concrete | Purpose <br> Implied but easy to identify based upon context or source | Purpose <br> Explicitly stated; clear, concrete with a narrow focus |
| Text Structure | Organization of Main Ideas Connections between an extensive range of ideas, processes, or events are deep and often implicit or subtle; organization of the text is intricate or specialized for a particular discipline | Organization of Main Ideas Connections between an expanded range of ideas, processes, or events are deeper and often implicit or subtle; organization may contain multiple pathways and may exhibit traits common to a specific discipline | Organization of Main Ideas Connections between some ideas or events are implicit or subtle; organization is evident and generally sequential | Organization of Main Ideas Connections between ideas, processes, or events are explicit and clear; organization of text is clear or chronological or easy to predict |
|  | Text Features If used, are essential in understanding content | Text Features <br> If used, greatly enhance the reader's understanding of content | Text Features If used, enhance the reader's understanding of content | Text Features If used, help the reader navigate and understand content but are not essential |
|  | Use of Images If used, extensive, intricate, essential integrated images, tables, charts, etc., necessary to make meaning of text; also may provide information not otherwise conveyed in the text | Use of Images If used, essential integrated images, tables, charts, etc., may occasionally be essential to understanding the text | Use of Images If used, images such as indexes and glossaries are mostly supplementary to understanding of the text; graphs, pictures, tables, and charts directly support the text | Use of Images <br> If used, images are simple and unnecessary to understanding the text but directly support and assist in interpreting the written text |
| Language Features | Conventionality Dense and complex; contains abstract, ironic, and/or figurative language | Conventionality <br> Complex; contains some abstract, ironic, and/or figurative language | Conventionality <br> Largely explicit and easy to understand, with some occasions for more complexmeaning | Conventionality <br> Explicit, literal, straightforward, easy to understand |
|  | Vocabulary Generally unfamiliar, archaic, subject- specific, or overly academic language; may be ambiguous or purposefully misleading | Vocabulary <br> Somewhat complex language that is sometimes unfamiliar, archaic, subjectspecific, or overly academic | Vocabulary Mostly contem porary, familiar, conversational; rarely unfamiliar or overly academic | Vocabulary Contemporary, familiar, conversational language |
|  | Sentence Structure <br> Mainly complex sentences, often containing multiple concepts | Sentence Structure <br> Many complex sentences with several subordinate phrases or clauses and transition words | Sentence Structure <br> Simple and compound sentences, with some more complex constructions | Sentence Structure Mainly simple sentences |
| Knowledge Demands | Subject Matter Knowledge <br> Extensive, perhaps specialized or even theoretical disciplinespecific content knowledge; range of challenging abstract and theoretical concepts | Subject Matter Knowledge Moderate levels of discipline-specific content knowledge; some theoretical knowledge may enhance understanding; range of recognizable ideas and challenging abstract concepts | Subject Matter Know ledge Everyday practical knowledge and some discipline-specific content knowledge; both simple and more complicated, abstract ideas | Subject Matter Knowledge <br> Everyday, practical knowledge; simple, concrete ideas |
|  | Intertextuality Many references or allusions to other texts or outside ideas, theories, etc. | Intertextuality Some references or allusions to other texts or outs ide ideas, theories, etc. | Intertextuality A few references or allusions to other texts or outside ideas, theories, etc. | Intertextuality <br> No references or allusions to other texts, or outside ideas, theories, etc. |

## APPENDIX J: OPERATIONAL ADMINISTRATION 2019-2020 AFTER SCHOOL CLOSURE

Chapter Fifteen (Operational Administration 2019-2020) contains summary information about the operational administration of the Classroom Diagnostic Tools (CDT) during the 2019-2020 school year from the start of the school year (August 19, 2019) through the school closures as a result of Covid-19 (March 13, 2020). A small number of CDT tests were completed after school closures through the end of the CDT test year (August 14, 2020). Those are summarized in this appendix.

## MAKING CDT AVAILABLE AWAY FROM SCHOOL

Beginning on May 18, 2020, the Classroom Diagnostic Tools (CDT) were available for students to be tested athome. This testing option allowed students to access the CDT from a "public" browser without the need to have it previously installed on their computers or being configured to the district's Central Office Services network. The test-setup tasks that teachers/school assessment coordinators routinely complete for classroom administrations of the CDT were the same for the at-home administrations. Test tickets (login credentials) were distributed directly to the students by school staff.

All CDTs (Full and Diagnostic Category) were available for use. However, it was highly recommended to only have students take the Diagnostic Category CDTs. Students and their parents/guardians benefited from a much shorter testing experience by using the Diagnostic Category tests, which are aligned to current instructional content. The shorter, more focused testing still provided teachers and administrators with the same level of timely reporting and instructional resources to help inform instruction and planning during distance learning.

## FREQUENCIES

Tables in this section present information about the number of students who were administered one or more CDT test in the 2019-2020 school year after school closures on March 13, 2020.

Tables $\mathrm{J}-1 \mathrm{a}$ and $\mathrm{J}-1 \mathrm{~b}$ show the number of students who have taken each CDT during the closure period. A student who took the same CDT test twice during this timeframe is counted only once.

Table J-1a. Number of Students Taking a Full CDT during Closure Period by Grade Level

Tables J-2a and J-2b show the number of students taking multiple CDT tests during the closure period. Since very few students tested diagnostic category CDT tests during this timeframe (see table $\mathrm{J}-1 \mathrm{~b}$ ), diagnostic category CDT tests are rolled up and counted with their corresponding full CDT test.

Table J-2a. Number of Students in Grades 3 through 5 Taking Multiple CDT Tests during Closure

| Grades 3 through 5 | Math | Reading | Science | Writing |

[^0]:    ${ }^{1}$ CDTs with the "Lower Grades" designation are for students in grades 3 through 5.

[^1]:    ${ }^{2}$ The alignment of Mathematics, Reading/Literature, and Writing/English Composition to the Pennsylvania Core Standards did not include field-test items for Writing/English Composition, as the Writing/English Composition pool did not require additional items to be fully aligned to the Pennsylvania Core Standards.

[^2]:    * Eligible Content for Kindergarten, Grade 1, and Grade 2 are not included in the Mathematics CDT.

[^3]:    * Eligible Content for Kindergarten, Grade 1, and Grade 2 are not included in the Reading/Literature CDT.

[^4]:    * Eligible Content for Kindergarten, Grade 1, and Grade 2 are not included in the Writing/English Composition CDT.

[^5]:    ${ }^{1}$ While font size follows specific requirements during online setup of an exam, the screen resolution used at the local level can impact the effective font size visible to the student.

[^6]:    ${ }^{1}$ Items in grade 5 were part of the fall 2013 embedded field test.

[^7]:    ${ }^{2}$ Items classified as C+ or C- have strong evidence of DIF. The plus sign indicates that the item favors the focal group (female or black or Hispanic) and a minus sign indicates that the item favors the reference group (male or white). For more details, see the section in this chapter on Differential Item Functioning.

[^8]:    *Data Review Committee, PDE, and DRC

[^9]:    ${ }^{3}$ Based on the population of CDT testers, ethnicity DIF on the white/Hispanic pairing was not run prior to 2018.

[^10]:    ${ }^{1}$ For multiple-choice (MC) items with four response options, pure random guessing would lead to an expected $p$-value of 0.25 .

[^11]:    ${ }^{2}$ As noted earlier, the discrimination index for dichotomous MC items is typically referred to as the point-biserial correlation coefficient. For EBSR items, the item-test correlation is sometimes used.
    ${ }^{3}$ It is legitimate to view the point-biserial correlation as a standardized mean. A positive value indicates students who chose that response had a higher mean score than the average student; a negative value indicates students who chose that response had a lower-than-average mean score.

[^12]:    ${ }^{1}$ The change in horizontal linking design after the Mathematics field test was in response to lower-than-expected participation. Using the same horizontal links on all forms within a grade results in higher $n$-counts.

[^13]:    ${ }^{2}$ The change in vertical linking design after the Mathematics field test was in response to lower-than-expected participation.

[^14]:    ${ }^{1}$ The center of the green range for grades 2 through 4 was extrapolated from grades 5 and above prior to the launch of each CDT for students in grades 3 through 5 in spring of 2014. See Chapter Nineteen for details.

[^15]:    ${ }^{1}$ Not everyone agrees with this sentiment. Some have argued the opposite point-that is, any attempt to add meaning to test scores actually predisposes the scores to be misinterpreted (see Angoff, 1984).

[^16]:    ${ }^{1}$ At that time, there were five diagnostic categories in CDT Mathematics.

[^17]:    ${ }^{2}$ At that time, there were five diagnostic categories in CDT Mathematics.

[^18]:    ${ }^{3}$ Key Ideas and Details, Craft and Structure/Integration of Knowledge and Ideas, Vocabulary

[^19]:    ${ }^{4}$ Key Ideas and Details, Craft and Structure/Integration of Knowledge and Ideas, Vocabulary

[^20]:    ${ }^{1}$ Less than $7 \%$ of students take only diagnostic category tests.

[^21]:    ${ }^{2}$ For details on benchmark cuts, see Chapter Ten and Chapter Nineteen.

[^22]:    ${ }^{3}$ Score differences between diagnostic categories are based on full CDTs because scores are based on the same test event. Comparisons are not made based on diagnostic category CDTs which may be taken at very different times.

[^23]:    ${ }^{4}$ The standard error was estimated based on simulations using the operational configuration of the CAT in terms of the content constraints and stopping rules.

[^24]:    ${ }^{1}$ A covariance term is not required, as true scores and error are assumed to be uncorrelated in classical test theory.

[^25]:    ${ }^{2}$ Spring 2019 PSSA and Keystone values are provided since there were no PSSA or Keystone tests administered in spring 2020 due to the school closures as a result of Covid-19.

[^26]:    ${ }^{3}$ True score is the score the person would receive if the measurement process were perfect.
    ${ }^{4}$ The standard deviation of a distribution is a measure of the dispersion of the observations. For the normal distribution, about 16 percent of the observations are more than one standard deviation above the mean.

[^27]:    ${ }^{5}$ Some prefer the following interpretation: if a student were tested an infinite number of times, the $\pm 1$ SEM confidence intervals constructed for each score would capture the student's true score 68 percent of the time.

[^28]:    ${ }^{6}$ Kappa, k, takes into account the agreement occurring by chance.

[^29]:    * Retest assuming no additional instruction

[^30]:    ${ }^{1}$ For results of all four methods for the 2011-2012 school year, see Chapter Eighteen of the 2011-2012 technical report.

[^31]:    ${ }^{1}$ It is not expected that students in grade 2 will use the CDT. However, teachers may want to use a grade 2 benchmark when looking at reports for students in grade 3, especially early in the school year.

[^32]:    ${ }^{3}$ Reading diagnostic categories changed at the start of the 2013-2014 school year due to re-alignment to the Pennsylvania Core Standards. See Chapter Thirteen for a list of the current diagnostic categories.

[^33]:    ${ }^{4}$ Writing diagnostic categories changed at the start of the 2013-2014 school year due to re-alignment to the Pennsylvania Core Standards. See Chapter Thirteen for a list of the current diagnostic categories.
